Depth (inches)	Matrix Color (moist)	%	Redox Features Color (moist)	%	Type[1]	Loc[2]	Texture	Remarks
see below								

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix, MS=Masked Sand Grains.

[2]Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators:

- ___ Histosol (A1)
- ___ Histic Epipedon (A2)
- ___ Black Histic (A3)
- ___ Hydrogen Sulfide (A4)
- ___ Stratified Layers (A5)
- ___ Depleted Below Dark Surface (A11)
- ___ Thick Dark Surface (A12)
- ___ Sandy Mucky Mineral (S1)
- ___ Sandy Gleyed Matrix (S4)
- ___ Sandy Redox (S5)
- ___ Stripped Matrix (S6)
- ___ Dark Surface (S7) (**LRR R, MLRA 149B**)
- ___ Polyvalue Below Surface (S8) (**LRR R, MLRA 149B**)
- ___ Thin Dark Surface (S9) (**LRR R, MLRA 149B**)
- ___ Loamy Mucky Mineral (F1) (**LRR K, L**)
- ___ Loamy Gleyed Matrix (F2)
- ___ Depleted Matrix (F3)
- ___ Redox Dark Surface (F6)
- ___ Depleted Dark Surface (F7)
- ___ Redox Depressions (F8)

Indicators for Problematic Hydric Soils[3]:

- ___ 2 cm Muck (A10) (**LRR K, L, MLRA 149B**)
- ___ Coast Prairie Redox (A16) (**LRR K, L, R**)
- ___ 5 cm Mucky Peat or Peat (S3) (**LRR K, L, R**)
- ___ Dark Surface (S7) (**LRR K, L**)
- ___ Polyvalue Below Surface (S8) (**LRR K, L**)
- ___ Thin Dark Surface (S9) (**LRR K, L**)
- ___ Iron-Manganese Masses (F12) (**LRR K, L, R**)
- ___ Piedmont Floodplain Soils (F19) (**MLRA 149B**)
- ___ Mesic Spodic (TA6) (**MLRA 144A, 145, 149B**)
- ___ Red Parent Material (F21)
- ___ Very Shallow Dark Surface (TF12)
- ___ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if observed):

Type: _____

Depth (inches): _____

Hydric Soil Present? Yes _____ No ✓

Remarks:

Unable to obtain soil data due to fill edge.

ACOE Wetland Function-Value Evaluation Forms

McCue Environmental, LLC
Lafayette Mill, 650 Ten Rod Road
North Kingstown, RI 02852

Wetland Function-Value Evaluation Form

Total area of wetland *>50 ac.* Human made?_____ Is wetland part of a wildlife corridor? *yes* or a "habitat island"?_____

Adjacent land use *Dense residential, commercial and industrial* Distance to nearest roadway or other development *270 ft. North*

Dominant wetland systems present *PFO1E* Contiguous undeveloped buffer zone present *Yes*

Is the wetland a separate hydraulic system? *No* If not, where does the wetland lie in the drainage basin? *Lower portion*

How many tributaries contribute to the wetland? *1* Wildlife & vegetation diversity/abundance (see attached list)

Wetland I.D. *WF100 - WF194*

Latitude *41.2633* Longitude *-72.8804*

Prepared by: *McCue* Date *4/24/24*

Wetland Impact:
Type_____ Area_____

Evaluation based on:
Office ✓ Field ✓

Corps manual wetland delineation completed? Y ✓ N_____

Function/Value	Suitability Y	Suitability N	Rationale (Reference #)*	Principal Function(s)/Value(s)	Comments
Groundwater Recharge/Discharge	✓		*1 (very few), 2, 4, 5, 7, 15*	✓	*pr.well: https://portal.ct.gov/dph/drinking-water/dws/public-water-supply-map*
Floodflow Alteration	✓		*1, 3, 4, 5, 6, 7, 8, 9, 10, 11, 13*	✓	*Rationale cont.: 15, 17, 18 (12 unknown)*
Fish and Shellfish Habitat	✓		*2, 4, 8, 14, 15, 16*		*(Freshwater)*
Sediment/Toxicant Retention	✓		*2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13*	✓	*Rationale cont.: 14, 16*

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:12,000.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: State of Connecticut, Western Part
Survey Area Data: Version 2, Aug 30, 2024

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jun 14, 2022—Oct 6, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
6	Wilbraham and Menlo soils, 0 to 8 percent slopes, extremely stony	2.0	0.2%
13	Walpole sandy loam, 0 to 3 percent slopes	22.2	1.9%

Appendix C- Regulatory Communication

Appendix C
Regulatory Communication

Date	Entity	Communication Summary
Feb 27, 2024	Hoyle Tanner Associates (HTA)	Follow-up meeting request with CT DEEP to clarify grassland and wetland mitigation requirements, with discussions on existing grassland and a bird survey proposal.
Feb 13, 2024 (meeting) + Feb 21, 2024 (follow-up email from the Feb 13 meeting)	HTA & Connecticut Department of Energy & Environmental Protection CT DEEP	Meeting held to discuss runway extension, terminal relocation, energy permits, and DEEP's 3:1 wetland mitigation ratio requirements. Feb 21 email highlights: - LWRD stated that enhancements of tidal wetlands could be used toward mitigation of inland wetland impacts. Regarding wetland impacts, DEEP requires a 3:1 mitigation ratio.
Jan 31, 2024	CT DEEP	Pre-application meeting scheduled for February 13, with CT DEEP's request for a draft mitigation plan to review in advance.
Jan 16, 2024	HTA	Initial request for pre-application meeting to discuss wetland, floodplain/FEMA, and stormwater permits.
May 17, 2024	CT DEEP to HTA	CT DEEP letter to HTA requesting additional information on the NDDB. Includes lists of state-listed plant and grassland bird species documented to occur within the vicinity of the airport.
September 26, 2024	CT DEEP	The Natural Diversity Database (NDDB) query results for the proposed project activities were received from the Connecticut Department of Energy and Environmental Protection (DEEP) on September 26, 2024 (dated September 24, 2024).
October 10, 2024	USACE to HTA	Letter from the Regulatory Program/Division of USACE to HTA that details an Approved Jurisdictional Determination (AJD) conducted by the U.S. Army Corps of Engineers for a site at Tweed New Haven Airport, Connecticut. It identifies jurisdictional waters (Wetland 6) under Section 404 of the Clean Water Act, along with non-jurisdictional wetlands (Wetlands 4 and 5).
November 18, 2024	CT DEEP	Communication from CT DEEP Fisheries Division on presence of NDDB review species non presence on the Morris Creek watershed.
November 25, 2024	HTA, eDesign Dynamics, CT DEEP, FAA, Avports	Monthly meeting notes with relevant permitting agency staff regarding permits for the projects.
February 18, 2025	USACE to HTA	USACE provides initial feedback on the draft mitigation plan, emphasizing the need to evaluate all mitigation options per the 2008 Mitigation Rule hierarchy and to clarify the plan's terminology, performance standards, legal site protection,

		adaptive management triggers, financial assurances, and reliance on tide gate infrastructure.
February 21, 2025	CT DEEP to HTA	CT DEEP confirms that the proposed 28.5 acres of tidal wetland enhancement can be applied at a 5:1 ratio to mitigate for 5.7 acres of inland wetland impact, while the remaining 3.8 acres of impact must be addressed through 1:1 tidal wetland creation, resulting in a net gain of wetland area. CT DEEP also provides technical and regulatory feedback on salinity conditions, tide gate management, mapping requirements, and long-term site protection.

Hi Camille- we would like to discuss further and clarify the expectations for mitigation for grassland habitat and wetlands- can we have a meeting this week or next with the relevant participants to address this?

Specifically:

1. We have reviewed the existing grassland habitat on site and do not think the proposed impacts will result in a loss of functional grassland habitat that would reduce the grassland on the airport below the 23 acres required by the permit in 2007.
2. We are proposing a grassland bird survey to occur this spring and summer to document bird use.
3. The existing grasslands are mowed per the vegetation plan agreed to by FAA and CTDEEP, and includes wetlands as currently delineated. We believe the wet grassland areas are not functional grassland habitat and would offer a revised version of existing grassland on airport to date with regard to the need for identifying and creating functional off-site mitigation.
4. Wetland mitigation work continues and we would like to review the CTDEEP mitigation requirements based on the 3:1 ratio in terms of offering on-site restoration of tidal wetlands for inland wetland impacts.

Thank you-

Kimberly Peace

Subject: RE: [External] RE: Pre-application Meeting Request : Tweed New Haven Airport Runway Extension and East Terminal Project

It was a pleasure to meet with you regarding your current state of the proposed activity. Thank you to all who attended.

The applicant's main goal for this meeting was to re-address the items concerning the runway extensions to the north and south and the Terminal re-location (East Terminal) at the TWEED New Haven Airport
site in more detail than previously discussed with CTDEEP staff during the EA process. The applicant is developing permit applications for wetland, floodplain/FEMA and stormwater impacts and would like assistance in submitting those in a timely manner. Also
for discussion, was the renewable sources of solar energy generation and geothermal wells proposed to be used on site. The permitting requirements for a solar array and geothermal energy use were discussed briefly. The location and design of the potential
solar arrays and geothermal system are currently in preliminary design stages only and were not included in the EA.

Based upon the information presented at the meeting, a summary of the permitting requirements is as follows:

Land and Water Resources Division (LWRD): your contacts are Jeff Caiola, Brian Thompson, Sue Jacobson and Danielle Missell.

- The applicant posed a few questions regarding submittal of permit applications:
    - Can the existing authorizations be amended to include this proposed activity? *No, the existing Structures, Dredging & Fill and Tidal Wetland authorization includes a permit condition that states that the applicant must submit a new application for any additional impacts that may be created.*
    - The CTDEEP permits issued to date have been to the Tweed New Haven Regional Airport Authority (TNHAA), as recorded in our department database.
    - It was recommended to submit CTDEEP applications first before United States Army Corps of Engineers (USACE) submittal. The CTDEEP applications may take 9 - 12 months to process.
    - The project will need an USACE Individual 404 permit and a state 401 WQC.
    - DEEP will publish a public notice of its tentative decision to approve a permit application to receive public comment. DEEP will also hold an informal meeting or formal administrative hearing (if needed). For more info, see the **Public Participation (DEP-FS-005) Factsheet.**
    - It was recommended that the applicant have a conversation with the municipalities on any local permitting requirements.

- Can TNHAA submit permit application before Mitigation Plans completed? *No, the application should include a draft mitigation plan. DEEP will not publish a Notice of Tentative Determination without an approved wetland mitigation plan.*
    - LWRD stated that enhancements of tidal wetlands could be used toward mitigation of inland wetland impacts.
- Can upland work begin before other licenses are issued for wetlands impact? *No, 22 acres of grassland may have regulatory requirements- wetland impact and mitigation plans must be reviewed and approved.*

- Applicant has indicated 9.3 acres of wetland impacts. DEEP requires a 3:1 mitigation ratio. USACE requires in lieu fee, which may be discounted to account for state mitigation. Jared Fritz is the PM for USACE.
- Applicant stated that the grasslands plantings proposed to be used for mitigation purposes may conflict with FAA rules of safety along the runways. *LWRD has offered to have additional meetings on mitigation and permit compliance.*
- USACE is having a 3rd party consultant review the proposed wetland impacts. Status will be checked on this review.
- Applicant requested new evaluation of wetlands jurisdiction from USACE; will need to apply for the WOTUS jurisdiction re-evaluation.
- Floodway – The project should be designed to be consistent with the National Flood Insurance Program requirements.
- Floodplains – since the airport acts as a bowl to collect and store floodwaters, measures to mitigate the loss of any floodwater storage must be evaluated.
- FEMA – LWRD stated they would assist the applicant review FEMA requirements that may be imposed.
- Additional questions posed concerning Floodways/Floodplains:
    - Assumption Zone AE, no increase to BFE +1 ft, no CLOMR-if needed, can permit condition approval? *No, CLOMR cannot be a condition of the permit. If a CLOMR is required it must be received prior to TWEED submitting an application. Further TWEED must clearly demonstrate that there will be no adverse increases in flood heights from the proposed development.*
    - Does THNAA have to address zero net fill requirements from City of New Haven and Town of East Haven? *No, the project is located within a coastal flood hazard area, flood storage compensation is not required.*

Stormwater Program: your contact is Chris Stone.

- For disturbance of land, over 5 acres but less than 15 acres, regardless of phasing, the applicant would need to register under DEEP's stormwater construction general permit as a locally exempt project at least 60 days before beginning construction (if disturbance is greater than 15 acres the registration would need to be submitted at least 90 days before beginning construction). The applicant will need to submit their registration through ezFile. Refer to the following link for instructions. https://portal.ct.gov/DEEP/Water-Regulating-and-Discharges/Stormwater/Construction-Stormwater-GP.
- The applicant may submit this registration at any time but note that if CTDEEP or CT Siting Council requirements alter your design, the registration for the construction stormwater

general permit would need to be modified and would result in re-starting the timeline for registration.
- Please refer to the Stormwater Quality Manual, and the Connecticut Guidelines for Soil Erosion and Sediment Control, to address specific details. Note that the Water Quantity Retention Volume has been increased to 1.3 inches of rainfall.

Natural Diversity Database: your contact is Robin Blum.

- Note that for the permits required above, a final determination from our NDDB Program will be required to be submitted with the applications/registrations, since there are known occurrences of state or federally-listed species within the impact area of the project site. The request for review to the NDDB Program should be submitted through our new eNDDB portal.
    - Here are the links for eNDDB submissions:
        - Account setup - https://filings.deep.ct.gov/DEEPPortal/Account/About
        - NDDB webpage - https://portal.ct.gov/DEEP/NDDB/Requests-for-NDDB-Environmental-Reviews
        - eNDDB FAQs - https://portal.ct.gov/DEEP/NDDB/NDDB-Frequently-Asked-Questions
        - Maps - https://portal.ct.gov/DEEP/NDDB/Natural-Diversity-Data-Base-Maps
- At this time, review work may take up to 10 weeks; however, if further survey work is needed during a certain time of year, the process can take longer overall.

Environmental Review: your contacts are Fred Riese and Eric Hammerling.

- Projects generating over 1 MW of energy, where any energy generated will be connected to the grid, will need to be reviewed by the CT Siting Council. If the energy is used solely for internal use at the TNHAA (no connection to the grid), then there is no need for this part of the proposal to be reviewed by the CT Siting Council.

Innovative Partnerships and Planning (IPP) - Concierge: your contact is Camille Fontanella.

- IPP Concierge can continue to provide assistance to the applicant before and during permit application submittal through permit processing to ensure application submittal timeliness and effective communication on permit application statuses.
- The applicant indicated plans to submit permit applications in June, with permit issuance in December. Processing time for the LWRD permits will take longer than the 6-months proposed. We can work with you to assemble complete applications to optimize processing time.

Please contact us if you have further questions. I have copied everyone who was in attendance at the meeting.

Meanwhile, if you could help us improve our pre-application process, we would appreciate it! Please complete the attached quick follow-up survey!

Thank you!

Hi Beatriz- the intent of the pre-app meeting is to address the items in more detail that have been previously discussed with CTDEEP staff during the EA process as we move into developing permit applications. Our main goal for this meeting is to progress on submitting the wetland, floodplain/FEMA and stormwater permits in a timely manner- if there is tie in with the energy permitting then we will be prepared to address that at the meeting also. We included them in the form for completeness of the project.

The permitting requirements for a solar array and geothermal energy use that are being reviewed by the applicant, which were not included in the EA, could be discussed as well if there is time and the meeting is conducive to that. Should we need to schedule a separate meeting with the specific staff relative to these items, I would be happy to work directly with them if you provide contacts.

I have attached additional information regarding the location and design of the potential solar arrays and geothermal system- these are currently in preliminary design stages only.

Please let me know if you need further information or have any other questions, thank you.

Subject: [External] RE: Pre-application Meeting Request : Tweed New Haven Airport Runway Extension and East Terminal Project

Good Morning,

On reviewing your questionnaire, in preparation for your pre-application meeting, we have a few questions to be sure we have the applicable permitting staff attending this meeting.

There have been several meetings with DEEP on the airport's renovations including the runway extension and the East Terminal project as outlined in the questionnaire submittal.

Is this new request for a pre-application meeting solely concerning the generation and storage of energy of 2 MW?

If so, can you provide more detail concerning the energy portion of this project? Please include a site plan, showing the energy sources and details of how they are proposed to be placed on site. You mention geothermal wells but there is no

other mention of other energy sources to use and store. Once we have more details on your request, we can schedule a meeting with the applicable permitting staff.

Thank you,

Beatriz Milne, P.E.

NDDB Request Additional Information
Project: Tweed New Haven Airport Runway Extension and Terminal Expansion
Filing ID 107828

Dear Ms. Coon,

As described in the NDDB review application, this project will involve the rehabilitation and extension of Runway 2-20, and the construction of a new east side passenger terminal and associated runways, parking lots, aprons and taxiways.

The following species have been documented within the vicinity of the work to be conducted:

Plants

- Yellow thistle (*Cirsium horridulum*) – State Endangered
  - Habitat: Coastal grasslands; airports; open-canopy trailsides and roadsides; inner salt marsh borders; *Juniperus-Panicum virgatum* communities, scrub communities, and forest edges bordering salt marshes.
  - Blooms June – July.
- Saltpond grass (*Leptochloa fusca ssp. fascicularis*) – State Endangered
  - Habitat: Coastal, in brackish ponds and shores of "salt ponds", borders of salt and brackish marshes, sandy depressions in coastal grasslands and sandy roadsides that are flooded by the highest mesohaline or polyhaline spring tides of the year. Populations found inland growing along highways are not believed to be of native Connecticut provenance.
  - Blooms and fruits August – November.
- Field paspalum (*Paspalum laeve*) – State Threatened
  - Habitat: Mostly near the coast, extending inland in the Connecticut River towns only as far as Cromwell and Glastonbury, and disjunct as a historic in Franklin. Hydric to moderately well drained fields, meadows, grasslands, floodplain grasslands and meadows, thickets, and shores, seasonally flooded and exposed open-canopy vernal pools. Utility ROWs, airports near the coast. Tolerant of mowing, at least at some sites. Critical Habitats include: Alluvial Grassland/Outcrop; Grassland Subtype: Coastal Grassland.
  - Fruits August – October.
- Two-flowered Cynthia (*Krigia biflora*) – State Threatened
  - Habitat: Dry to wet meadows, fields, rocky woods, and roadsides.

    - Blooms Jun.
- Hoary plantain (*Plantago virginica*) – State Special Concern
    - Habitat: Dry acidic or basic, rocky, sandy, or gravelly soil. Pastures, grasslands, floodplain levee and stream bank forests, roadsides, low traprock outcrops in old fields, calcareous (high-pH) open woodlands, dry fields, gravel banks, traprock ridges. Critical Habitats: Subacidic Rocky Summit/Outcrop; Subacidc Rocky/Summit Outcrops (probably); Floodplain Forest, High Floodplain Subtype; Dry Circumneutral Forest.
    - Blooms/fruits May – June. Spring and early summer ephemeral, typically disappearing by late June.

State listed plant species surveys of the site should be performed by a qualified botanist or plant ecologist when these target plant species are identifiable. You may want your botanist to contact the NDDB program directly for more information regarding known plant locations. The report summarizing the results of such surveys should include:

1. Survey date(s) and duration.
2. Site descriptions and photographs, and photographs of any state listed plant species found.
3. Descriptions of the identifying characters of the target listed species.
4. List of component species within the survey area (including scientific binomials).
5. Data regarding population numbers and/or area occupied by state listed plant species.
6. Detailed maps of the area surveyed including the survey route and locations of state listed species.
7. Habitat descriptions of the area surveyed.
8. Survey results and all observed state listed plant species must reported to the NDDB Program using an NDDB form at: https://portal.ct.gov/DEEP/Endangered-Species/Contributing-Data
9. If state listed plants are found within the project area or immediately adjacent to the project area, the report should include a conservation/protection plan with the following elements:
    a. Anticipated impacts to these state-listed species from this project.
    b. Any planned mitigation or management practices that will be employed to protect, avoid, and/or mitigate impacts to state listed plant species.
10. A Statement, CV or Resume of the botanist's or plant ecologist's qualifications to work with these species. Please ensure that your botanist or plant ecologist holds appropriate scientific collector's permit for this work.

Grassland Birds

- Grasshopper sparrow (*Ammodramus savannarum*) – State Endangered
- Horned lark (*Eremophila alpestris*) – State Endangered
- Eastern meadowlark (*Sturnella magna*) – State Threatened
- Bobolink (*Dolichonyx oryzivorus*) – State Special Concern
- Savannah sparrow (*Passerculus sandwichensis*) – State Special Concern

The Project is expected to impact 5.6 acres of grassland habitat.

NDDB received an application to review this project in 2022 (NDDB Preliminary Assessment 202201593). Our preliminary assessment letter included information for the above-referenced grassland bird species, including general recommendations for managing grassland birds at airports and noted that field surveys are

recommended. The preliminary assessment also instructed that the airport should comply with any pre-existing mitigation plans prepared to protect grassland birds on the property. NDDB did not receive any communication in response to the Preliminary Assessment and closed that review on March 3, 2023.

NDDB was provided a copy of the *Grassland Bird Habitat Conceptual Plan*, dated April 8, 2024; this document was prepared to address prior permitting requirements for grassland habitat within the airport boundary, document existing grassland habitat, and to propose a study of bird use and functionality of existing grassland habitat at the airport. Through review of this plan, NDDB concluded that changes to conditions outlined in the original 2008 *Grassland Management Plan* had been made in 2009 and 2011; specifically, beginning in 2009, the mowing regime agreed to in that plan was no longer being followed. NDDB provided comments responsive to this *Grassland Bird Habitat Conceptual Plan* via email on April 25, 2024.

Following the meeting between DEEP staff and Tweed-New Haven Airport representatives on April 29th, 2024, it was made clear that there is no remaining suitable grassland habitat on the property due to the mowing regime adopted in 2009. NDDB has been informed that the changes were implemented in response to airport hazard assessment and are not likely to be revised.

The *Grassland Bird Habitat Conceptual Plan* proposes to conduct grassland bird survey studies in order to understand grassland habitat conditions and use of the property. As NDDB has indicated via email comments and during subsequent meetings, NDDB welcomes this survey work as a valuable source of information, and we concur with the survey protocols proposed. However, survey work and information gathering alone does not constitute mitigation for loss of habitat resulting from project activities.

We have included the protection measures here as a reference in the event that it is deemed possible to allow habitat to regenerate on the property in the future. Barring that, these guidelines can be used as a starting point in the development of an off-site mitigation plan, as it seems unlikely that negative impacts to listed grassland bird species neither have been nor will be able to be minimized on the airport property. Since impacts to grassland birds have already been committed and earlier plan mowing regimes are not able to be implemented, **off-site mitigation should be pursued**.

Grassland Bird Protection Measures

The horned lark, grasshopper sparrow, Savannah sparrow, bobolink and eastern meadowlark are considered to be grassland-obligate birds. They require open fields to breed, nest and forage in. Habitats preferred by these species include large grasslands, agricultural fields, and airports. The breeding season for these birds is approximately from late April through August. It is during this period that they are most susceptible to disturbances in their feeding and nesting habitat.

To avoid impact to these species:

- Land disturbance activities including digging, ground clearing, heavy machinery driving staging, or ground trampling that will occur more than 100 feet into a grassland parcel or cut across parcels of grassland in a way that fragments grassland habitat patches should be done when grassland birds are not breeding. Breeding primarily takes place between April 15- August 15.
- Conducting land disturbance activities outside of the breeding season will avoid impact to the individuals.
- **Conduct project work between August 16- April 14.**

- Any upland grassed areas that may be disturbed during the course of the project, should be reseeded using an FAA-approved mix of warm season grass species including:
  - Little bluestem (*Schizachyrium scoparium*)- "Aldous" or "Cimarron"
  - Big bluestem (*Andropogon gerardii*)- "Niagra"
  - Indiangrass (*Sorghastrum nutans*) - "Rumsey"
  - Switchgrass (*Panicum virgatum*) - "Blackwell", "Shelter", or "Cave in Rock"
  - Bermudagrass (*Cynodon dactylon*) - "Quickstand"
- Seed mix ratios are variable, however for Connecticut a minimum of 60% little bluestem is preferred. Big bluestem is an acceptable alternative to little bluestem for the dominant species in the chosen mix. When one of the bluestems is the dominant species the other grass species listed may be mixed in any ratio desired. Of these species, Bermudagrass is the least favored and should be used in the lowest percentage.

If work cannot occur between months of August 16-April 14:

- The proposed construction staging area and associated vehicles and equipment should be restricted to existing paved areas as much as possible.
- Beginning April 1- through duration of project: All grassy areas within a 50-foot buffer of planned work remain continuously mowed as short as possible to avoid attracting nesting birds into work zones.
- If vehicle access is required to cross grassy areas outside of work zones, designated paths and areas should be marked and kept mowed beginning April 1. Do not drive outside of designated work areas into grassy habitat, nesting birds will be crushed.
- Identify locations on the property where grassland habitat will remain un-mowed between April 15 - August 30 to mitigate for lost habitat during construction. These areas must provide adequate conditions for upland grassland habitat. Provide a map detailing these grassland mitigation areas to Robin Blum (robin.blum@ct.gov).
- Any upland grassed areas that may be disturbed during the course of the project, should be reseeded using an FAA-approved mix of warm season grass species as described above.

Your request has been assigned the following number: **107828; please include this number on all correspondence regarding this request**.
Responsive information should be sent to:

Robin Blum
Wildlife Division- Natural Diversity Data Base
79 Elm St. 6th Floor
Hartford, CT 06106-5127
or submitted via email to: robin.blum@ct.gov

Please note that if the necessary information is not received by May 20, 2025, we will be unable to provide a determination. Materials already submitted will not be retained or returned. You will need to initiate a new review request by submitting a new and complete *Request for Natural Diversity Database (NDDB) State Listed Species Review* via DEEP's ezFile Portal. For more information and guidance on submitting a request for a Natural Diversity Data Base review visit our website. Feel free to contact me if you have further questions.

---

Hi Kim,

In response to your comments below:

- *the project was proposed in the NDDB request for review as mitigation site review, not tide gate alteration- this change seems to indicate that the proposed actions are being viewed as a stand-alone project which is not the case- the tide gate alteration is an important part of the Runway and Terminal Project compensatory mitigation*

  NDDB referenced tide gate management in our correspondence to differentiate activities addressed in this review from activities addressed in the Runway and Terminal project. This was intended to provide specificity for permit analysts and any other folks that will review our letters as part of permit application package or other reviews. Moving forward, when we issue a Final Determination, we can utilize the larger project name and include narrative statements to make that distinction.
- Plant surveys in impact areas – I brought our Monday discussion to Bill; he agreed that it is an acceptable preliminary approach to have your consulting botanist assess the on-the-ground conditions in the impact areas which can be utilized to determine next steps. Your botanist should determine if suitable habitat is present and prepare a description of those findings. If suitable habitat exists, include an assessment of whether or not proposed activities will impact target species, and, if so, any measures that can be taken to prevent impacts. Having that information will help us decide if further survey work is appropriate and necessary. Let us know if you would like to discuss further; it might be beneficial for your botanist to communicate with Bill on the finer details.

Please let me know if you have any questions.

Robin

Subject: RE: [External] NDDB Filing 117005 Tweed - tide gate management - request additional information

EXTERNAL EMAIL: This email originated from outside of the organization. Do not click any links or open any attachments unless you trust the sender and know the content is safe.

Hi Jeff, Susan and Danielle- I am forwarding this to you to keep everyone in the loop on this information that we received this morning. I want to first note that the project was proposed in the NDDB request for review as mitigation site review, not tide gate alteration- this change seems to indicate that the proposed actions are being viewed as a stand-alone project which is not the case- the tide gate alteration is an important part of the Runway and Terminal Project compensatory mitigation.

We believe that the review that was completed should be revised in light of the fact that the proposed alteration of the tidal regime is for *salt marsh restoration* that is proposed to happen in a gradual manner by primarily tidal flow manipulation. The proposed mitigation design will allow the impacted areas of the marsh to restore over time based on alteration to the hydrologic regime rather than with intensive physical methods. Because of this, we believe that the populations of listed species, including plants, birds and fish, if within the affected areas, would have time to shift as needed, making surveys unnecessary.

We recognize you are waiting on more details to be provided in the Mitigation Plan and we anticipate providing it in a Draft form to CTDEEP within the next few weeks for review and comment.

A majority of the tidal marshes are *Phragmites* monocultures, making surveys within these areas difficult, time-consuming and questionably feasible. Additionally, surveys for most of the plant species listed cannot be completed in 2024 as the identification window has passed or almost passed, which means we would have to complete field surveys, if required, in 2025.

This will have a negative impact on the schedule for permitting and construction for the project.

Surveys for the state-listed grassland birds have already occurred at the airport with only Savannah sparrow as being identified as using these areas. We appreciate your acknowledgement that impacts to grassland birds are being mitigated for as part of the Runway and Terminal project, which the tide gate alteration is an important component of, and we will continue discussions with you regarding that mitigation- keeping that moving forward is currently dependent on response to the questions provided in my email of September 6 that we were told would be provided this week, which we have not yet received.

We will include review of this information as an agenda item for Monday's meeting as we believe that resolving these concerns will be crucial to the overall project schedule, however I suspect we will need to have additional meetings to focus specifically on this in the future.

Thank you-

Project: Tweed New Haven Runway Extension and Terminal Expansion – Tide Gate Alteration
NDDB 202408268 Request for Additional Information
Filing ID: 117005
Expiration date: September 24, 2025

Dear Deb Coon,

We have received and reviewed the materials submitted pursuant to a Natural Diversity Data Base review request for Tide Gate Alteration at Tweed Airport, New Haven project. According to our records, populations of State listed species have been documented in the vicinity of the project area.

Plants:

- Yellow thistle (*Cirsium horridulum*) – State Endangered
  Habitat: Coastal grasslands; airports; open-canopy trail sides and roadsides; inner salt marsh borders; *Juniperus-Panicum virgatum* communities, scrub communities, and forest edges bordering salt marshes.
  Blooms: June, July
- Salt pond grass (*Leptochloa fusca ssp. Fascicularis*) – State Endangered
  Habitat: Coastal, in brackish ponds and shores of "salt ponds", borders of salt and brackish marshes, sandy depressions in coastal grasslands and sandy roadsides that are flooded by the highest mesohaline or polyhaline spring tides of the year. Populations found inland growing along highways are not believed to be of native Connecticut provenance.
  Blooms and fruits August - November
- Field paspalum (*Paspalum laeve*) - State Threatened
  Habitat: Mostly near the coast, extending inland in the Connecticut River towns only as far as Cromwell and Glastonbury, and disjunct as a historic in Franklin. Hydric to moderately well drained fields, meadows, grasslands, floodplain grasslands and meadows, thickets, and shores, seasonally flooded and exposed open-canopy vernal pools. Utility ROWs, airports near the coast. Tolerant of mowing, at least at some sites. Critical Habitats include: Alluvial grassland/Outcrop, Grassland Subtype; Coastal Grassland.
  Fruits August – October
- Swamp lousewort (*Pedicularis lanceolata*) – State Threatened
  Habitat: Moist fields, swamp edges, wet ground, wet meadows, open swamps, stream edges, fresh tidal wetlands.
  Blooms mid-August, September
- Two-flowered cynthia *(Krigia biflora*) - State Threatened
  Habitat: Dry to wet meadows, fields, rocky woods, and roadsides.
  Blooms June
- Hoary plantain (*Plantago virginica*) – State Special Concern

Habitat: Dry acidic or basic, rocky, sandy, or gravelly soil. Pastures, grasslands, floodplain levee and stream bank forests, roadsides, low traprock outcrops in old fields, calcareous (high-pH) open woodlands, dry fields, gravel banks, traprock ridges. Critical Habitats: Subacidic Rocky Summit/Outcrop; Subacidc Rocky/Summit Outcrops (probably); Floodplain Forest, High Floodplain Subtype; Dry Circumneutral Forest. Blooms/fruits May-June. Spring and early summer ephemeral, typically disappearing by late June.

- New England blazing star (*Liatris novae-angliae*) – State Special Concern
  Habitat: Sandplains, dry fields, sandy sea beaches, rock outcrops, sandy or rocky roadsides.
  Blooms Aug, September

State listed plant species surveys of the site should be performed by a qualified botanist or plant ecologist when these target plant species are identifiable. You may want your botanist to contact the NDDB program directly for more information regarding known plant locations. The report summarizing the results of such surveys should include:

1. Survey date(s) and duration.
2. Site descriptions and photographs, and photographs of any state listed plant species found.
3. Descriptions of the identifying characters of the target listed species.
4. List of component species within the survey area (including scientific binomials).
5. Data regarding population numbers and/or area occupied by state listed plant species.
6. Detailed maps of the area surveyed including the survey route and locations of state listed species.
7. Habitat descriptions of the area surveyed.
8. Survey results and all observed state listed plant species must reported to the NDDB Program using an NDDB form at: https://portal.ct.gov/DEEP/Endangered-Species/Contributing-Data
9. If state listed plants are found within the project area or immediately adjacent to the project area, the report should include a conservation/protection plan with the following elements:
   a. Anticipated impacts to these state-listed species from this project.
   b. Any planned mitigation or management practices that will be employed to protect, avoid, and/or mitigate impacts to state listed plant species.
10. A Statement, CV or Resume of the botanist's or plant ecologist's qualifications to work with these species. Please ensure that your botanist or plant ecologist holds appropriate scientific collector's permit for this work.

Please send the survey report to deep.nddbrequest@ct.gov and robin.blum@ct.gov. Please note that incomplete reports may be rejected.

Fish:

- Sand tiger shark (*Carcharias taurus*) – State Special Concern
- Atlantic seasnail (*Liparis atlanticus*) – State Special Concern
- Radiated shanny (*Ulvaria subbifurcata*) – State Special Concern

Contact a DEEP Fisheries Biologist for more information regarding potential impacts to listed fish species. You may need to submit a fisheries consultation form.

Birds:

In Connecticut, grasslands are among the most threatened and rare habitats. There are seven species of breeding grassland birds and that require grasslands as their primary habitat that are state listed in Connecticut. Most of Connecticut's grasslands would revert to forest without active management. Increasing development pressures on Connecticut's most important grassland habitats, exacerbates this loss of habitat

through natural succession. Traffic and construction in suitable habitat should be avoided during sensitive timeframes.

Grasshopper sparrow (*Ammodramus savannarum*) – State Endangered
Most sensitive to disturbance: May 1- August 30. This species will benefit from protection and management of large patches of grassland of 30 acres or more.

Eastern meadowlark (*Sturnella magna*) – State Threatened
Most sensitive to disturbance between May 1- August 15. This species will benefit from protection and management of large patches of grassland of 15 acres or more.

Savannah sparrow (*Passerculus sandwichensis*) – State Special Concern
Most sensitive to disturbance between April 1- August 30. This species will benefit from protection and management of large patches of grassland of 10 acres or more.

Bobolink (*Dolichonyx oryzivorus*) – State Special Concern
Most sensitive to disturbance between May 1- August 30.
This species will benefit from protection and management of large patches of grassland of 5 acres or more.

NDDB program staff is currently working with Tweed Airport and consultants regarding proposed actions to address impacts to grassland birds under the auspices of the Runway Extension and Terminal Expansion project. Any potential negative impacts to listed grassland bird species from the proposed Tide Gate Alteration project activities will be addressed through mitigation under that project. A Final Determination for the Tide Gate Alteration project will not be issued until grassland bird mitigation has been finalized.

Regulatory Program/Division
NAE-2022-00290

Kimberly Peace
Hoyle Tanner & Associates, Inc.
150 Dow Street
Manchester, New Hampshire 03101
Via Email: kpeace@hoyletanner.com

Dear Ms. Peace:

This letter is in response to your request to the New England District for an approved jurisdictional determination. The project/review area is located on Tweed New Haven Airport, at Latitude 41.276190 and Longitude -72.885720 in East Haven, South Central Connecticut Planning Region County, Connecticut. The review area for this determination is limited to an approximately 18 acre area, which is illustrated on the enclosed site maps. This request has been assigned the file number NAE-2022-00290. This file number should be referenced in all correspondence concerning this project.

Based on our review of the information you furnished, a site inspection conducted on July 22, 2024, and other information available to our office, we have determined the above-referenced area contains 14.96 acres of waters of the United States under U.S. Army Corps of Engineers (USACE) regulatory jurisdiction. These waters are identified in the enclosed site maps, Tweed New Haven Airport dated November 30, 2021, and include Wetland 4, Wetland 5, and Wetland 6. This determination was made in accordance with the USACE regulatory authority pursuant to Section 404 of the Clean Water Act, and based upon criteria contained in the 1987 Corps of Engineers Wetland Delineation Manual and the Northcentral and Northeast regional supplement. This determination is valid for a period of **five years** from the date of the letter, unless new information warrants revision of the determination before the expiration date or a District Engineer has identified, after public notice and comment, that specific geographic areas with rapidly changing environmental conditions merit re-verification on a more frequent basis.

This letter contains an approved jurisdictional determination for your subject site. If you object to this determination, you may request an administrative appeal under USACE regulations at 33 CFR Part 331. Enclosed you will find a Notification of Appeal Process (NAP) fact sheet and request for appeal (RFA) form. If you request to appeal this determination you must submit a completed RFA form to the Division Appeals Officer at the address listed on the RFA form. In order for an RFA to be accepted by

USACE, USACE must determine that it is complete, that it meets the criteria for appeal under 33 CFR part 331.5, and that it has been received by the Division Office within 60 days of the date of the NAP. Should you decide to submit an RFA form, USACE must receive it by USACE by December 9, 2024. **It is not necessary to submit an RFA form to the Division Office if you do not object to the determination in this correspondence.**

Section 404 of the Clean Water Act requires a Department of the Army (DA) permit be obtained prior to the discharge of dredged or fill material into waters of the United States, including wetlands. Section 10 of the Rivers and Harbors Act of 1899 requires a DA permit be obtained for any work in, on, over or under navigable waters of the United States.

This determination has been conducted to identify the limits of USACE Clean Water Act jurisdiction for the review area identified in this request. The determination may not be valid for the wetland conservation provisions of the Food Security Act of 1985. If you or your tenant are USDA Program participants, or anticipate participation in USDA programs, you should request a certified wetland determination from the local office of the Natural Resources Conservation Service, prior to starting work.

You are cautioned that work performed below the mean high water line or ordinary high water line in waters of the United States; and/or, the discharge of dredged or fill material into any areas identified on the enclosed information as within Federal jurisdiction, without a Department of the Army permit could subject you to enforcement action. Receipt of a permit from a state or local municipality does not obviate the requirement for obtaining a Department of the Army permit.

If you have any questions concerning this correspondence, please contact Andrea Williams, Project Manager, CT/RI Section of the New England District Office at 978-318-8494, by mail at the above address, or by email at andrea.n.williams@usace.army.mil. Please take a moment to complete our customer satisfaction survey located at https://regulatory.ops.usace.army.mil/customer-service-survey/.

Sincerely,

Kevin R Kotelly

Kevin Kotelly, P.E.
Chief, CT/RI Section

NOTIFICATION OF ADMINISTRATIVE APPEAL OPTIONS AND PROCESS AND REQUEST FOR APPEAL

Applicant: Kimberly Peace	File Number: NAE-2022-00290	Date: 10/10/2024
Attached is:		See Section below
	INITIAL PROFFERED PERMIT (Standard Permit or Letter of permission)	A
	PROFFERED PERMIT (Standard Permit or Letter of permission)	B
	PERMIT DENIAL WITHOUT PREJUDICE	C
	PERMIT DENIAL WITH PREJUDICE	D
X	APPROVED JURISDICTIONAL DETERMINATION	E
	PRELIMINARY JURISDICTIONAL DETERMINATION	F

SECTION I

The following identifies your rights and options regarding an administrative appeal of the above decision. Additional information may be found at https://www.usace.army.mil/Missions/Civil-Works/Regulatory-Program-and-Permits/appeals/ or Corps regulations at 33 CFR Part 331.

A: INITIAL PROFFERED PERMIT: You may accept or object to the permit

- ACCEPT: If you received a Standard Permit, you may sign the permit document and return it to the district engineer for final authorization. If you received a Letter of Permission (LOP), you may accept the LOP and your work is authorized. Your signature on the Standard Permit or acceptance of the LOP means that you accept the permit in its entirety, and waive all rights to appeal the permit, including its terms and conditions, and approved jurisdictional determinations associated with the permit.

- OBJECT: If you object to the permit (Standard or LOP) because of certain terms and conditions therein, you may request that the permit be modified accordingly. You must complete Section II of this form and return the form to the district engineer. Upon receipt of your letter, the district engineer will evaluate your objections and may: (a) modify the permit to address all of your concerns, (b) modify the permit to address some of your objections, or (c) not modify the permit having determined that the permit should be issued as previously written. After evaluating your objections, the district engineer will send you a proffered permit for your reconsideration, as indicated in Section B below.

B: PROFFERED PERMIT: You may accept or appeal the permit

- ACCEPT: If you received a Standard Permit, you may sign the permit document and return it to the district engineer for final authorization. If you received a Letter of Permission (LOP), you may accept the LOP and your work is authorized. Your signature on the Standard Permit or acceptance of the LOP means that you accept the permit in its entirety, and waive all rights to appeal the permit, including its terms and conditions, and approved jurisdictional determinations associated with the permit.

- APPEAL: If you choose to decline the proffered permit (Standard or LOP) because of certain terms and conditions therein, you may appeal the declined permit under the Corps of Engineers Administrative Appeal Process by completing Section II of this form and sending the form to the division engineer. This form must be received by the division engineer within 60 days of the date of this notice.

C. PERMIT DENIAL WITHOUT PREJUDICE: Not appealable
You received a permit denial without prejudice because a required Federal, state, and/or local authorization and/or certification has been denied for activities which also require a Department of the Army permit before final action has been taken on the Army permit application. The permit denial without prejudice is not appealable. There is no prejudice to the right of the applicant to reinstate processing of the Army permit application if subsequent approval is received from the appropriate Federal, state, and/or local agency on a previously denied authorization and/or certification.

D: PERMIT DENIAL WITH PREJUDICE: You may appeal the permit denial
You may appeal the denial of a permit under the Corps of Engineers Administrative Appeal Process by completing Section II of this form and sending the form to the division engineer. This form must be received by the division engineer within 60 days of the date of this notice.

E: APPROVED JURISDICTIONAL DETERMINATION: You may accept or appeal the approved JD or provide new information for reconsideration

- ACCEPT: You do not need to notify the Corps to accept an approved JD. Failure to notify the Corps within 60 days of the date of this notice means that you accept the approved JD in its entirety and waive all rights to appeal the approved JD.

- APPEAL: If you disagree with the approved JD, you may appeal the approved JD under the Corps of Engineers Administrative Appeal Process by completing Section II of this form and sending the form to the division engineer. This form must be received by the division engineer within 60 days of the date of this notice.

- RECONSIDERATION: You may request that the district engineer reconsider the approved JD by submitting new information or data to the district engineer within 60 days of the date of this notice. The district will determine whether the information submitted qualifies as new information or data that justifies reconsideration of the approved JD. A reconsideration request does not initiate the appeal process. You may submit a request for appeal to the division engineer to preserve your appeal rights while the district is determining whether the submitted information qualifies for a reconsideration.

F: PRELIMINARY JURISDICTIONAL DETERMINATION: Not appealable
You do not need to respond to the Corps regarding the preliminary JD. The Preliminary JD is not appealable. If you wish, you may request an approved JD (which may be appealed), by contacting the Corps district for further instruction. Also, you may provide new information for further consideration by the Corps to reevaluate the JD.

POINT OF CONTACT FOR QUESTIONS OR INFORMATION:

If you have questions regarding this decision you may contact:	If you have questions regarding the appeal process, or to submit your request for appeal, you may contact:
Ryan Malterud Acting Deputy Chief, Regulatory Division U.S. Army Corps of Engineers, New England District 696 Virginia Road Concord, MA 01742-2751 Phone: (651)508-2261 Email: Ryan.M.Malterud@usace.army.mil	Mr. Andrew Dangler, Regulatory Appeals Review Officer U.S. Army Corps of Engineers North Atlantic Division – Fort Hamilton 301 John Warren Avenue – First Floor Brooklyn, NY 11252-6700 Mobile: (518) 487-0215 Email: andrew.c.dangler@usace.army.mil

SECTION II – REQUEST FOR APPEAL or OBJECTIONS TO AN INITIAL PROFFERED PERMIT

REASONS FOR APPEAL OR OBJECTIONS: (Describe your reasons for appealing the decision or your objections to an initial proffered permit in clear concise statements. Use additional pages as necessary. You may attach additional information to this form to clarify where your reasons or objections are addressed in the administrative record.)

ADDITIONAL INFORMATION: The appeal is limited to a review of the administrative record, the Corps memorandum for the record of the appeal conference or meeting, and any supplemental information that the review officer has determined is needed to clarify the administrative record. Neither the appellant nor the Corps may add new information or analyses to the record. However, you may provide additional information to clarify the location of information that is already in the administrative record.

RIGHT OF ENTRY: Your signature below grants the right of entry to Corps of Engineers personnel, and any government consultants, to conduct investigations of the project site during the course of the appeal process. You will be provided a 15-day notice of any site investigation and will have the opportunity to participate in all site investigations.

_____ Signature of appellant or agent.	Date:
Email address of appellant and/or agent:	Telephone number:

Administrative Appeal Process for Approved Jurisdictional Determinations

696 VIRGINIA ROAD
CONCORD, MASSACHUSETTS 01742-2751

CENAE-RD-CTRI 10 October 2024

MEMORANDUM FOR RECORD

SUBJECT: US Army Corps of Engineers (USACE) Approved Jurisdictional Determination in accordance with the "Revised Definition of 'Waters of the United States'"; (88 FR 3004 (January 18, 2023) as amended by the "Revised Definition of 'Waters of the United States'; Conforming" (8 September 2023) ,[1] NAE-2022-00290 MFR 1 of 1.[2]

BACKGROUND. An Approved Jurisdictional Determination (AJD) is a USACE document stating the presence or absence of waters of the United States on a parcel or a written statement and map identifying the limits of waters of the United States on a parcel. AJDs are clearly designated appealable actions and will include a basis of JD with the document.[3] AJDs are case-specific and are typically made in response to a request. AJDs are valid for a period of five years unless new information warrants revision of the determination before the expiration date or a District Engineer has identified, after public notice and comment, that specific geographic areas with rapidly changing environmental conditions merit re-verification on a more frequent basis.[4]

On January 18, 2023, the Environmental Protection Agency (EPA) and the Department of the Army ("the agencies") published the "Revised Definition of 'Waters of the United States,'" 88 FR 3004 (January 18, 2023) ("2023 Rule"). On September 8, 2023, the agencies published the "Revised Definition of 'Waters of the United States'; Conforming", which amended the 2023 Rule to conform to the 2023 Supreme Court decision in *Sackett v. EPA*, 598 U.S., 143 S. Ct. 1322 (2023) ("*Sackett*").

This Memorandum for Record (MFR) constitutes the basis of jurisdiction for a USACE AJD as defined in 33 CFR §331.2. For the purposes of this AJD, we have relied on Section 10 of the Rivers and Harbors Act of 1899 (RHA),[5] the 2023 Rule as amended,

[1] While the Revised Definition of "Waters of the United States"; Conforming had no effect on some categories of waters covered under the CWA, and no effect on any waters covered under RHA, all categories are included in this Memorandum for Record for efficiency.
[2] When documenting aquatic resources within the review area that are jurisdictional under the Clean Water Act (CWA), use an additional MFR and group the aquatic resources on each MFR based on the TNW, the territorial seas, or interstate water that they are connected to. Be sure to provide an identifier to indicate when there are multiple MFRs associated with a single AJD request (i.e., number them 1, 2, 3, etc.).
[3] 33 CFR 331.2.
[4] Regulatory Guidance Letter 05-02.
[5] USACE has authority under both Section 9 and Section 10 of the Rivers and Harbors Act of 1899 but for convenience, in this MFR, jurisdiction under RHA will be referred to as Section 10.

as well as other applicable guidance, relevant case law, and longstanding practice in evaluating jurisdiction.

1. SUMMARY OF CONCLUSIONS.

    a. There are three (3) delineated aquatic resource features within the project's review area:

        i. Wetland 4 (1.32-acres; 57,499 sf), non-jurisdictional Section 404

        ii. Wetland 5 (2.45-acres; 106,722 sf), non-jurisdictional Section 404

        iii. Wetland 6 (14.96-acres; 651,657 sf), jurisdictional Section 404

2. REFERENCES.

    b. "Revised Definition of 'Waters of the United States'; Conforming" 88 FR 61964 (September 8, 2023)

    c. *Sackett v. EPA*, 598 U.S., 143 S. Ct. 1322 (2023)

3. REVIEW AREA.

The AJD review area consists of Tweed New Haven Regional Airport (the "Airport") is a public airport located in the City of New Haven and Town of East Haven, CT, owned and operated by the City of New Haven (see Figure 1, Figure 2). The property is located along the New Haven-East Haven town-line with Long Island Sound approximately ¾-mile to the south, New Haven Harbor ¼ mile to the west, and Morris Cove approximately ¼-mile to the southwest. The Airport has two asphalt runways, Runway 2-20 which is approximately 5,200 feet long by approximately 150 feet wide oriented north-south, and Runway 14-32 (currently not in use) which is approximately 3,600 feet long by 100 feet wide with a northwest – southeast orientation.

According to field observations and a review of recent aerial photographs of the review area (Image 3), the Airport is set within a mixed residential, commercial, and industrial area. To the west of the Airport (between Dean Street and Townsend Avenue), land use is mostly residential whereas to the east (along Proto Drive and Commerce Street), it is mostly industrial. There is undeveloped land (wetlands) to the south of Runway 2-20 and to the southeast of the HVN property boundary.

Areas interior to and surrounding the runways and taxiways are comprised of maintained grasslands. Along the southwestern, southern, and southeastern perimeter of the airport are extensive vegetated tidal wetland systems with constructed channels and areas of open water. Inland wetlands occur at the northwestern, northern, northeastern, and eastern edges of the runway and taxiway areas. Some of the inland wetlands appear to have been constructed as drainage features as they do not appear on U.S. Fish and Wildlife Service (USFWS) National Wetland Inventory (NWI) (Figure 4) or CT Department of Energy and Environmental Protection (CTDEEP) wetland mapping. Previous wetland delineations by others did not identity wetland resources within these infield areas (Figure 3a) and a request for a jurisdictional determination was submitted for these wetlands.

Project Review Area
The Project Review Area is outlined in Figure 3A (yellow outline) with a center point at latitude/longitude: 41.261029N, 72.882639W. Figure 3d depicts the layout of the delineated wetlands (green dotted outline) and the potential avenue on the project site.

Historic aerial photographs show that the Project Review Area has been extensively modified since before the 1930s. Aerial imagery from 1934 (Image 1) shows unmodified land and a watercourse system that flows right through where the airport runways would be placed between 1934 and 1949 (Image 2).

4. NEAREST TRADITIONAL NAVIGABLE WATER (TNW), THE TERRITORIAL SEAS, OR INTERSTATE WATER TO WHICH THE AQUATIC RESOURCE IS CONNECTED. [6]
   Morris Creek is a tidally influenced system made of salt marshes and controlled by a tide gate located at 41.250692N, 72.892217W which discharges into Long Island Sound.

5. FLOWPATH FROM THE SUBJECT AQUATIC RESOURCES TO A TNW, THE TERRITORIAL SEAS, OR INTERSTATE WATER.
   i. Wetland 1-3; 7 (outside of Review Area): Delineated wetlands directly abut relatively permanent water or have a distinct flow path to a TNW (Figure 3A).
   ii. Wetland 4 (within the Review Area): Delineated wetland area does not physically abut or touch an (a)(1), (a)(2), or (a)(3) water, nor does it have a continuous surface connection to such waters via a non-jurisdictional conveyance (e.g., swale, culvert, storm drain) (Image 4 and 5).

[6] This MFR should not be used to complete a new stand-alone TNW determination. A stand-alone TNW determination for a water that is not subject to Section 9 or 10 of the Rivers and Harbors Act of 1899 (RHA) is completed independently of a request for an AJD. A stand-alone TNW determination is conducted for a specific segment of river or stream or other type of waterbody, such as a lake, where upstream or downstream limits or lake borders are established.

iii. Wetland 5 (within the Review Area): Delineated wetland area does not physically abut or touch an (a)(1), (a)(2), or (a)(3) water, nor does it have a continuous surface connection to such waters via a non-jurisdictional conveyance (e.g., swale, culvert, storm drain) (Image 6 – 9).

iv. Wetland 6 (within the Review Area): Delineated wetland area including Wetland 6A and 6B (Image 10, 14, and 15) has a continuous surface connection to a perennial stream system that connects through a network of streams, wetland systems, and drainage ditches. Wetland 6 drains to the south to Tuttle Brook, a tributary of Morris Creek, which deposits into Long Island Sound. Conveyance methods were observed in the form of culverts along Pig Farm Road (Image 11 and 12) and at the end of Pig Farm Road running parallel to Proto Drive (Image 13).

6. SECTION 10 JURISDICTIONAL WATERS[7]: Describe aquatic resources or other features within the review area determined to be jurisdictional in accordance with Section 10 of the Rivers and Harbors Act of 1899. Include the size of each aquatic resource or other feature within the review area and how it was determined to be jurisdictional in accordance with Section 10.[8]

   There are no resources subject to Section 10 of the Rivers and Harbors Act of 1899 in the review area.

7. SECTION 404 JURISDICTIONAL WATERS: Describe the aquatic resources within the review area that were found to meet the definition of waters of the United States in accordance with the 2023 Rule as amended, consistent with the Supreme Court's decision in *Sackett*. List each aquatic resource separately, by name, consistent with the naming convention used in section 1, above. Include a rationale for each aquatic resource, supporting that the aquatic resource meets the relevant category of "waters of the United States" in the 2023 Rule as amended. The rationale should also include a written description of, or reference to a map in the administrative record that shows, the lateral limits of jurisdiction for each aquatic resource, including how that limit was determined, and incorporate relevant references used. Include the size of each aquatic resource in acres or linear feet and attach and reference related figures as needed.

[7] 33 CFR 329.9(a) A waterbody which was navigable in its natural or improved state, or which was susceptible of reasonable improvement (as discussed in § 329.8(b) of this part) retains its character as "navigable in law" even though it is not presently used for commerce, or is presently incapable of such use because of changed conditions or the presence of obstructions.

[8] This MFR is not to be used to make a report of findings to support a determination that the water is a navigable water of the United States. The district must follow the procedures outlined in 33 CFR part 329.14 to make a determination that water is a navigable water of the United States subject to Section 10 of the RHA.

a. Traditional Navigable Waters (TNWs) (a)(1)(i): N/A

b. The Territorial Seas (a)(1)(ii): N/A

c. Interstate Waters (a)(1)(iii): N/A

d. Impoundments (a)(2): N/A

e. Tributaries (a)(3):

f. Adjacent Wetlands (a)(4): Wetland 6 is a 14.96-acre, contiguous wetland system characterized by two different wetland types: Wetland 6A consists of palustrine emergent wetlands within a mowed lawn airfield. Wetland 6B consists of a palustrine forested broad-leaved deciduous, seasonally saturated, wetland (PFO1E), and bordering palustrine emergent wetlands (PEM2) containing non-persistent, persistent and Phragmites-dominated subclasses. An upper reach of Morris Creek bisects the PFO portion of this wetland east of Taxiway C and Runway 32. Sheet flow runoff from the adjacent runways and taxiways and direct precipitation contribute to the hydrology of this wetland, however portions of the wetland are transected by permanently flooded / excavated channels lending evidence of a suspected high groundwater elevation. Seasonal flooding along Morris Creek also likely contributes to the sustaining hydrology of the wetland. *Acer rubrum* dominates the PFO portion, while *Phragmites australis* has significant cover in the PEM portion. Other hydrophytes noted included the following: *Lindera benzoin*, *Vaccinium corymbosum*, *Ilex verticillata*, *Viburnum dentatum*, *Clethra alnifolia*, *Lythrum salicaria*, *Spiraea tomentosa*, *Euthrochium maculatum*, *Juncus effusus*, *Euthamia caroliniana*, *Eupatorium perfoliatum*, , and east of Taxiway C (Wetland 6B). To the west of the former runway 14/32 within the mowed portion of the RSA (Wetland 6A), the wetland is dominated by *Paspalum laeve*, *Rhynchospora capitellata, Cyperus strigosu*s, and *Setaria pumila* ssp. *pumila*.

To determine the potential for Wetland 6 to have a continuous surface connection to waters of the U.S., staff reviewed aerial photographs from 1934 to 1990 (Images 1 – 3). During a site visit on July 22, 2024, staff observed culverts installed along Proto Drive and Pig Farm Road that provide an observable connection between Wetland 6 and the unnamed stream that drains into tidal wetlands and Morris Creek. Consequently, we evaluated field site dates for the site visit date for antecedent precipitation and compared the precipitation to a normal range. Our antecedent precipitation analysis result (Figure 5) revealed wetter than normal conditions. A review of hydrologic connectivity and USGS

StreamStats show the natural and artificial connection from Wetland 6 to Morris Creek (Figure 6, Figure 7). To validate this concept, staff analyzed the State of Connecticut 2016 LiDAR elevation data (Figure 8) for water conveyance through the project review area. In addition, photographs taken from the site visit depict two culverts that allow flow from Wetland 6 and the unnamed stream abutting the wetland to tidal wetlands downstream and Morris Creek (Image 11 – 13). Our evaluation revealed evidence that Wetland 6 has a continuous surface connection via non-jurisdictional conveyance (culverts). Consequently, the wetland area contributes flow to Morris Creek and Long Island Sound.

g. Additional Waters (a)(5): N/A

8. NON-JURISDICTIONAL AQUATIC RESOURCES AND FEATURES

a. Describe aquatic resources and other features within the review area identified in the 2023 Rule as amended as not "waters of the United States" even where they otherwise meet the terms of paragraphs (a)(2) through (5). Include the type of excluded aquatic resource or feature, the size of the aquatic resource or feature within the review area and describe how it was determined to meet one of the exclusions listed in 33 CFR 328.3(b).[9]

The applicant did not identify or delineate any non-jurisdictional excluded water features in the Review Area. Aerial imagery from 1934 onward do not depict any farmland or roadside ditches within the project Review Area.

b. Describe aquatic resources and features within the review area that were determined to be non-jurisdictional because they do not meet one or more categories of waters of the United States under the 2023 Rule as amended (e.g., tributaries that are non-relatively permanent waters; non-tidal wetlands that do not have a continuous surface connection to a jurisdictional water).

i. Wetland 4: We evaluated the 1.32-acre resource feature identified as Wetland 4 for potential landscape connectivity and a continuous surface connection to waters described in Section 4 above. Wetland 4 is a shallow drainage area located north of Runway 32 and is bound by Taxiway C to the northeast and Taxiway H to the southwest. The consultant characterized Wetland 4 as a palustrine emergent, nonpersistent, intermittently flooded/saturated (PEM2J) wetland. It receives sheet flow runoff from the impervious runways and tarmacs. It is dominated by various species of hydrophytic plant species such as *J. effusus*, *C. strigosus*, *Rumex crispus*, *P. laeve*, and *Symphyotrichum*

[9] 88 FR 3004 (January 18, 2023)

lateriflorum. A catch basin serves as the outlet that regulates the surface water level of the wetland when it receives collected stormflows. Based upon its morphology and drainage structures, it appears that this wetland has formed within a drainage area that was constructed with the adjacent Runway 14/32 and Taxiways Band C were built. While it is a routinely mowed lawn, since Runway 14/32 has not been used for years, routine maintenance of the basin has declined which may have allowed for the development of hydrophytic plant community. Refer to Table 1, Figure 3d, and Images 4 and 5.

ii. Wetland 5: We evaluated the 2.45-acre resource feature identified as Wetland 5 for potential landscape connectivity and a continuous surface connection to waters described in Section 4 above. Wetland 5 is a shallow drainage area bounded by Taxiway C to the northeast and southeast, Taxiway H to the northwest, and former Runway 32 to the southwest. The consultant characterized the wetland as palustrine emergent, nonpersistent, intermittently flooded (PEM2J) that collects sheet flow runoff and direct precipitation. During the initial delineation, high levels of standing water were observed in this catch basin, which may indicate high groundwater levels in this area. Hydrophytic vegetation observed within this wetland included the following: *J. effusus*, *C. strigosus*, *P. leave*, *Coleataenia longifolia* ssp. *longifolia*, *Echinochloa muricata*, *Eleocharis obtusa*, *Juncus acuminatus*, *Ludwigia palustris*, *Persicaria hydropiperoides*, *Schoenoplectus pungens* var. *pungens*, *S. pumila* ssp. *pumila*, and *S. lateriflorum*. A catch basin serves as the outlet that regulates the surface water level of the wetland when it receives stormflows. Based upon its morphology and drainage structures, this wetland may have also formed within a drainage area that was constructed with the adjacent Runway 14/32 and Taxiways Band C were built, similar to Wetland 4. Wetland 5 was a routinely mowed lawn, however, since Runway 14/32 has not been used for years, routine maintenance of the basin has declined. Refer to Table 1, Figure 3d, and Images 6 – 9.

9. DATA SOURCES. List sources of data/information used in making determination. Include titles and dates of sources used and ensure that information referenced is available in the administrative record.

   a. Field visit completed on 22 July 2024

   b. CT ECO UCONN Aerial and Lidar Elevation Viewers (2019, 2012, 2009, 2004, and 1934 Aerial Photographs and 2016 Elevation); 30 August 2024

   c. U.S. Fish and Wildlife Service National Wetlands Inventory Mapper; 30 August 2024

d. Antecedent Precipitation Tool; 30 August 2024

e. National Regulatory Viewer, North Atlantic division, Connecticut; 22 April 2024

f. U.S. Geological Survey StreamStats; 30 August 2024

g. CT State Library Aerial Survey 1965; 11 September 2024

h. U.S. Department of Agriculture, Natural Resources Conservation Service Web Soil Survey; 11 September 2024

10. OTHER SUPPORTING INFORMATION. N/A

11. NOTE: The structure and format of this MFR were developed in coordination with the EPA and Department of the Army. The MFR's structure and format may be subject to future modification or may be rescinded as needed to implement additional guidance from the agencies; however, the approved jurisdictional determination described herein is a final agency action.

Subject: RE: [External] RE: Tweed Airport RW Extension, East Terminal and Tidal mitigation- Fisheries Consultation

Hi Kimberly,

I'm sorry that I have not been able to respond sooner to your emails. I have taken a look at the materials that you sent me and the three fish species noted in your NDDB review (Sand Tiger Shark, Atlantic Seasnail, and Radiated Shanny) are not present in the Morris Creek watershed. The NDDB reviews cover wide geographic areas and while those fish may be present in New Haven Harbor, they probably do not enter Morris Creek and definitely are not found upriver of the tide gates. While the NDDB reviews are only concerned with state-listed species (Endangered, Threatened, or Special Concern), the fisheries consultation assesses the impact of a permitted activity on all fisheries resources. I have not attended any of the previous meetings and the documents you sent me did not include enough information for me to complete my consultation.

My recommendation is that you send me any documents you feel are relevant to the project or its proposed mitigation. I will review them prior to Monday's meeting and may ask some additional questions then. If after the meeting I still have questions, then we can arrange to talk.

Thanks,

Bruce

Hi Susan, thank you for this quick response. Bruce if you have time to have a conversation or quick Teams meeting with me before that larger meeting, please let me know and I can bring you up to speed on what we are proposing, and/or send you materials that have been provided previously to assist in your understanding to supplement what was in the Fisheries Consultation form. I am working with our team to be able to provide a draft Mitigation Plan within the next few weeks which will have much more detail on the proposed tidal restoration, we have been hampered by changes in design that I believe will soon be resolved.

The good news is that we tested the tide gate for a “marination” event and it was a success in getting water levels to where we expect them to be necessary for drowning the Phrag and conversion to a more native state.

Thanks to all-

Kimberly Peace

Subject: Tweed Airport RW Extension, East Terminal and Tidal mitigation- Fisheries Consultation

Hello – please see the attached Fisheries Consultation Form for this project. We have been working with CTDEEP staff since January 2024 to develop permit applications for the Runway Extension and East Terminal building at Tweed New Haven Airport. While we initially submitted an NDDB review for the upland and freshwater wetland portions of the project, we submitted a second NDDB determination, at the request of Robin Blum, for the proposed tidal mitigation restoration that will be completed to offset inland wetland impacts for the project.

The tidal mitigation NDDB submittal package, and NDDB response, is attached. This response included three species that require coordination with your department:

Sand tiger shark (Carcharias taurus) – State Special Concern

Atlantic seasnail (Liparis atlanticus) – State Special Concern

Radiated shanny (Ulvaria subbifurcata) – State Special Concern

I can provide wetland reports with photos in a separate email of send you a sharepoint link to upload for your review due to the file sizes, however, we do not have plans for the tidal mitigation work at this time since the mitigation proposed will be adaptive. Initial efforts will consist of manipulation of the Morris Creek Tide Gate to allow for salinity to drown the existing Phragmites within the approximately 30 acres of deteriorated tidal salt marsh, which, along with physical removal of Phragmites, will allow for the marsh to rebound and the small populations of existing native marsh vegetation such as Spartina to expand. A

Mitigation Plan with more detailed information is in development and should be available within the next few weeks.

Because this plan will allow for a gradual shift in water levels and vegetation types, we do not anticipate impacts to the species of special concern that may be using the site currently as there should be time for species to shift accordingly to accommodate these changes. Additionally, because the resulting tidal marshes will provide a healthier ecosystem than the near monoculture of Phragmites that exists currently, we believe this project will benefit tidal and estuarine fisheries species that are currently within these habitats.

I would be happy to meet with you to discuss this project and the potential effects on these three species as needed. Please reach out to me, as I am the point of contact for the applicant for the project on behalf of Avports and The Tweed New Haven Airport Authority.

Thank you-

Amanda DeCesare (WSP) Amanda.decesare@wsp.com

Meeting Objective: Monthly discussion with relevant permitting agency staff regarding permits for the project. *Agenda items in italics.*

1. *Wetland Mitigation*
    - *Draft Plans currently showing conservative 9.72 acres inland wetland impacts*
    - *Wetland Mitigation Plan drafted and under internal review: field data collected has been analyzed, proposed restoration approach and adaptive management strategies identified, additional wetland delineations occurred and reporting to be finalized*
        - *Adjustments to tide gate operations to allow flooding of marsh with saline water up to 2.5' elevation and retention of water levels for up to 6 hours*
        - *Tide Gate operational changes to current programming of SCADA system*
        - *Prior to storm events, tide gate will be switched to Watershed Drain Mode to allow for adjustments to prevent flooding of adjacent properties*
        - *Scheduled mowing 2X/yr, early summer and late fall, and removal of Phragmites biomass*
        - *Consistent monitoring by wetland scientist and adaptation as needed*
        - *Adaptive Management Plan- to be based on how close to coming to meeting Performance Standards, to include, in stepwise fashion: herbicide application to*

Phragmites, extended elevated water level duration, excavation of tide channels, manual excavation of Phragmites and addition of sand and plantings of Spartina.

- *Tide gate tested to determine operational approach is viable – confirmed, minor tide gate changes may be needed to obtain water levels to reach goals*
- *Financial commitment requirements and process to be discussed.*
- ***DEEP notes:*** Wetland mitigation 9.72 acres – wetlands 4, 5, 6 – wetlands mitigation study is in review internal with Hoyle Tanner. Plant species were not found in tidal mitigation areas.
- Adaptive Management plan is step wise - Phragmites inundation study shows that the salt marination will be possible with the tide gates. May need minor repair to tide gates. Removing phrag with mowing and removal, and, finally, herbicide.
- Financial mitigation commitment requirements – **set up separate meeting with USACE and DEEP and Tweed.** Federal jurisdiction is only for 5-6 acres, wetlands 4 &5. DEEP discourages submittal of incomplete applications because the 401 times out in one year.

2. *Grassland Mitigation*

- *Impact has been revised to approx. 4 acres*
- *On-site Mitigation deemed not viable*
- *Grassland Mitigation Plan in development for Off-site mitigation via Warren parcel*
- R. Blum stated they are waiting on receipt of additional site information to review for confirmation as to the adequacy of the off-site mitigation parcel, K. Peace stated she will work with eDesign team to provide.
- **DEEP Notes:**
- 4 acre impact- On-site mitigation was not deemed feasible.
- Warren Parcel – have delineated separate ecosystems on the parcel – grasslands, wet meadow, vernal pool, swamp, etc. Robin reminds that there are questions about the soils and Wildlife hasn't signed off on the suitability of this parcel yet. Will need management plan and conservation approach for the property. Hoyle will be providing two documents Grassland Mitigation Plan and the Tidal Mitigation Plan. **Side meeting with Elsa (consultant) and Robin - asap**
- Hoyle has collected seeds as part of Plant Mitigation Plan. Working with Native Plant Trust.
- Fisheries – working with Bruce Williams. Hoyle sent additional information. – Will want side meeting. 3 species in NDDB review are not actually present in the Morris Creek area. Restoring tidal flows to marsh will have benefits to fish resources. **Tide gate meeting – Kimberly will reach back out.**

3. *NDDB/Listed Plant Species*

- *Identified Paspalum within inland field wetland*
- *Seeds collected to be included as piece of Plant Mitigation Plan.*
- R. Blum asked if we have been coordinating with the Native Plant Trust since they are short staffed, and if we have difficulties to let her and Bill know. K. Peace stated she will check with BSC and keep CTDEEP informed.
- *Fisheries coordination initiated for species identified as potential within tidal mitigation area*

- B. Williams stated the three state-listed species on the NDDB report for the tidal mitigation areas will not be affected by the tidal mitigation project, and restoring tidal flows to the tidal marsh not likely to impact fisheries, however he would like to discuss the project further w/K. Peace in regard to non-listed fish species review and requested additional information on the tide gate operational changes. K. Peace will coordinate that.

4. *FEMA/CLOMR/Stormwater*

- *CLOMR Process reviewed and initiated.*
- *FEMA pending 2025 LOMR estimated to be issued January.*
- *Design drawings sent to CTDEEP/FEMA and comments received re: increase freeboard of terminal.*
- *Terminal design currently being revised to address requirement for BFE+2 conservative.*
- ***DEEP Notes:***
- FEMA/ CLOMR/ Stormwater - coordinating with New Haven and East Haven to sign CLOMR application. **Will submit to FEMA in January.**
- Terminal design being adjusted to be BFE +2. (Requirement is +1).
- FAA has jurisdiction for NEPA. USACE provides comment on FAA's NEPA decision. 404B1 is USACE's analysis to permit the least environmentally damaging alternative. Hope that the preferred options in NEPA aligns with 404B1.

5. *Schedule*

- *Design for RW and Terminal in progress, current design submittal 12/11*
- *Expected permit application submittal week of 12/16*

- J. Caiola expressed concern over receiving an incomplete application and meeting a 6-month review time. Once the application is submitted, it becomes public record and a part of the freedom of information act (FOIA) so the public can receive a copy of the application and comment on it as well as get their own specialists to refute any aspects of it. If the NDDB, etc. are approved ahead of time, it allows staff to focus more on the review process and will reduce receiving any comments/questions from the public about aspects of the application that haven't been officially approved by CTDEEP. J. Caiola can put a hold on reviews of any state project but he cannot put a hold on federal projects so if the application is submitted without the normal mitigation plans, etc. approved, it can add time to the review process and the public hearing process.
- L. Robbins stated they would typically not review an application without CTDEEP Determination number.
- Suggested that coordination with CTDEEP Wildlife to receive a Determination, and with CTDEEP Wetlands staff to receive confirmation on wetland mitigation plan, before submitting permit application would be better since any information submitted with the permit application will become available under FOIA and could be rebutted by public. CTDEEP staff will also have to take time to respond to FOIA requests that will take away from time reviewing the application.
- C. Fontanella said she is working with Tom Cavaliere and Andrew King responding to public information requests, to address Environmental Justice and to prep for adjudication.
- J. Caiola stated the 401 Water Quality Certification (WQC) has a federally-mandated 1 year timeline for CTDEEP to take action, he will look further into if that License can be applied for

separately from the CTDEEP Inland Wetland permit, and if the Inland Wetland Permit anticipated adequacy hearing, which may take several months or more, would also delay the WQC. If CTDEEP cannot act on the WQC in one-year, has to be denied.

- J. Caiola also stated this meeting would satisfy the WQC Pre-Filing meeting requirement.
- J. Pritts stated USACE has to have the 401 WQC and CZMA addressed before they can issue the 404 permit. The 401 WQC has to go to EPA for review for at least 30 days, and then possibly for 60 more days to neighboring states if there is a "may effect" determination. USACE cannot start the 404 review until the 401 is received from CTDEEP per 404b1.
- For USACE a mitigation statement could be used for public notification process.
- If further tide gate operations will be discussed with B. Williams, J. Caiola stated he and other permit specialists from CTDEEP will want to be included.
- **DEEP Notes**:
- See Sue Jacobson's notes. Added below for convenience
- *Design for RW and Terminal in progress, current design submittal 12/11*
- *Expected permit application submittal week of 12/16*
- Wetland and grassland mitigation plans have not yet been finalized. DEEP staff recommend holding off on application submission until the plans have been reviewed and conceptually approved by LWRD and Wildlife Division staff. When staff receive the applications with completed mitigation plans, public inquiries will be less time consuming. (The public will request copies of the application and an incomplete application will cause confusion.)
- Final NDDB Determination. L. Robbins stated they would typically not review an application without a final NDDB Determination. The final NDDB Determination would most likely include the grassland mitigation plan.
- 401 Water Quality Certification (WQC). J. Caiola expressed concern over receiving an incomplete application (without mitigation plans finalized) and meeting a federally-mandated one-year WQC review time. While state program applications can be placed on 'hold', the 401 cannot. The WQC would be denied if the state could not meet the one-year deadline. The Structures, Dredging and Fill and 401 applications do not need to be submitted and processed simultaneously. It was suggested that the WQC application not be submitted until the SDF application was ready for public notice. (This submission delay is common for Dam Safety and WQC applications.) J. Caiola stated this meeting would satisfy the WQC Pre-Filing meeting requirement.
- 404 WQC. J. Pritts stated USACE has to have the 401 WQC and CZMA addressed before they can issue the 404 permit. The 401 WQC has to go to EPA for review for at least 30 days, and then possibly for 60 more days to neighboring states if there is a "may effect" determination. When the Corps receives the application, they publish their notice if the application is complete or not. A mitigation statement could be used for this public notification process. (However, the state needs their applications to be complete prior to their public notice.)

- Public participation. A hearing request is anticipated. While most applications can be reviewed within a year, a hearing would impact this standard timeframe. Freedom of Information Act requests are also anticipated. The submission of complete applications will be less confusing to the public and generate less documentation for the hearing record.
- C. Fontanella said she is working with Tom Cavaliere and Andrew King responding to public information requests, to address Environmental Justice and to prep for adjudication.

- If further tide gate operations will be discussed with B. Williams, J. Caiola stated he and other permit specialists from CTDEEP will want to be included.

6. **Action Items:**
    1. **Camille will coordinate meeting regarding financial assurance with relevant parties from USACE and CTDEEP**
    2. **K. Peace will coordinate with B. Williams re: Fisheries Coordination, set up meeting, provide additional info on tide gate operations.**
    3. **Hoyle Tanner will coordinate with New Haven and East Haven for required signatures for the CLOMR application, anticipated January submittal.**
    4. **Hoyle Tanner will let CTDEEP and USACE know if permit submittal timeline will shift.**
    5. **Agreement on next monthly meeting Monday Dec 30, 2024. CTDEEP will have answer by then on how to proceed with WQC and timeline in regard to the anticipated adequacy hearing.**
    6. Side meeting with Elsa (consultant) and Robin Blum - asap

Hi Kim and thanks for sending the meeting summary. I added Nate Margason and reattached the summary for his sake.

As promised, here are some initial thoughts of the draft mitigation plan after a cursory review:

1. The 2008 Mitigation Rule establishes a preference hierarchy for the type and location of compensatory mitigation (33 CFR 332.3(b)). It is my understanding that the airport is within the service area of an approved In-Lieu Fee Program. A discussion must be included in the mitigation plan which addresses and evaluates the feasibility of all mitigation types in the order of the preference hierarchy. At your request, I am looking for an example of such a discussion to provide and will do so when/if one becomes available.

Once item 1 is addressed and if the permittee-responsible mitigation is further considered then:

2. There is inconsistent use of the term's establishment vs. restoration. My understanding is that the site was previously thought to be tidal wetland, and this effort would restore it to the historical function. Please ensure the words, as defined in the 2008 mitigation rule, are consistently used so that proper consideration of credit can be evaluated.
3. There appears to be 5 specified objectives and 1 performance standard. Each stated objective should have associated performance standards so that success of the objective can be evaluated.
4. The land appears to be owned by the City of New Haven. If so, they would be the legal entity that would be encumbering their property through long-term site protection mechanisms. Please ensure they are aware of the potential restrictions and are on-board with placing such restrictions on their land.
5. The draft mitigation plan outlines when the first adaptive management plan would be implemented but is less clear about what factors would trigger phases 2, 3, and 4 to commence. The monitoring plan should be adapted to include provisions that would capture the additional timeframes that would be needed to effectively monitor progress after implementation of each adaptive management strategy.
6. There was discussion at the last meeting regarding areas which had previously been utilized for mitigation. At this time, I am unsure whether any of these areas were subject to previous Corps permit requirements. I will look to see what records I can locate. I request that any information regarding the history of Corps permits and their requirements be included in the application.
7. The district engineer shall require sufficient financial assurances to ensure a high level of confidence that the compensatory mitigation project will be successfully completed, in accordance with applicable performance standards. At this time, it appears that financial assurance will be needed in an amount sufficient to cover the initial construction, monitoring, and adaptive management provisions of the mitigation plan.
8. 33 CFR 332.7(b) states that: "Compensatory mitigation projects shall be designed, to the maximum extent practicable, to be self-sustaining once performance standards have been achieved. This includes minimization of

active engineering features (e.g., pumps) and appropriate siting to ensure that natural hydrology and landscape context will support long-term sustainability. Where active long-term management and maintenance are necessary to ensure long-term sustainability (e.g., prescribed burning, invasive species control, maintenance of water control structures, easement enforcement), the responsible party must provide for such management and maintenance. This includes the provision of long-term financing mechanisms where necessary. Where needed, the acquisition and protection of water rights must be secured and documented in the permit conditions or instrument." The current proposal relies on successful operation of the tide gate. Due to the criticality of this infrastructure for successful mitigation, the long-term financial assurance would likely include funding for the operation, maintenance, and eventual replacement of the tide-gate.

Memo

To: Kimberly Peace, Hoyle Tanner

From: Susan Jacobson, Supervising Environmental Analyst, West Regulatory

Date: February 21, 2025

Re: Wetland Mitigation for Tweed Airport Runway Extension and Terminal Expansion

---

Thank you for the opportunity to review the "*DRAFT Wetland Mitigation Plan Developed for Pre-application Review,*" (Mitigation Plan) dated December 2024. Comments on this Mitigation Plan and responses to other side discussions including wetland jurisdiction boundaries; application fee calculation; and, Pig Farm Road removal, are addressed in this memo.

The draft wetland mitigation plan proposes to compensate for **9.49 acres** of permanent inland wetland loss by performing **28.5 acres** of enhancement to restore brackish tidal wetland to historical saltwater tidal wetland by:
1) raising the elevation of the water upstream of the tide gates from 2.0' to 2.5' NAVD88;
2) mowing, cutting, and removing *Phragmites* biomass 2x/year, and,
3) adaptively managing (grading, planting, herbicide use) as needed to foster success.

Preliminary comments were provided to you which indicated that we could not accept mitigation at a site where previously authorized mitigation is offsetting prior wetland losses[1]. However, after a review of the previous mitigation requirements and the existing conditions of those mitigation sites, it has been determined that enhancement of these sites can be counted toward the proposed mitigation at a ratio of 5:1. The 28.5 acres of tidal wetland enhancement equates to the mitigation of 5.7 acres of impacted wetlands. **The remaining 3.8 acres of impact must be mitigated with 3.8 acres of tidal wetland creation/restoration for a result of a gain in square footage.**[2]

---

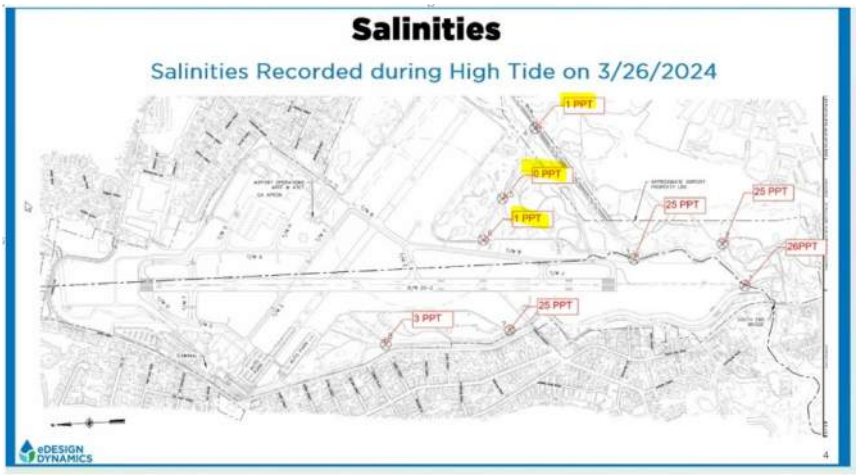
[1] The majority of the proposed 28.5-acre mitigation site, previously identified as the "Dean Street Mitigation Area," was required mitigation pursuant to Permit #20003049-KZ. An additional 3.9 acres of mitigation between Pig Farm Rd and Ora Ave was required under certificate of permission #201304084-KZ.
[2] Mitigation required by the U.S. Army Corps of Engineers may be different than state requirements.

GENERAL COMMENTS ON MITIGATION PLAN

Salinity and Elevation

Following prior mitigation efforts, including grading channels to bring tidal flow further upstream of the gate, the wetland appears to have reverted back to *Phragmites* based on recent delineation and botanical reporting. Salinity levels remain very low and *Phragmites* and inland wetland species dominate the proposed mitigation area.

- Please provide salinity data that demonstrates how wetland soil salinity in the mitigation area would support the proposed enhancement and reversion to tidal low marsh vegetation, and the eradication of Phragmites, given that dense Phragmites currently dominates the site.



The Mitigation Plan proposes to manipulate the tide gates to change the upstream water elevations from 2.0' to 2.5'. This elevation was determined based on the growth of *Spartina alterniflora* upstream of the tide gates.

- Please indicate the substrate elevation of the existing *Spartina*. If, after one year, significant reduction in phragmites density and height has not occurred, Adaptive Management Phase Three should be moved to Phase Two.

Tide Gate Management

The Mitigation Plan states that increasing upstream water elevations will not increase the risk of flooding to adjacent properties/residents, but no details are provided.

- Explain how raising water elevations by 0.5' at the mitigation site over ~28 acres would not increase the risk of flooding to nearby properties/residents/roads.
- Provide an inundation map that depicts proposed conditions given a 2.5' tide gate elevation.
- Please note a special condition of any final permit will require an annual report of tide gate operations to document the management goal is being achieved.
- In a January 22, 2025 memo to Bruce Williams, it is noted that the existing flap gate will be replaced with a third sluice gate. This modification will need to be proposed in the pending Structures, Dredging and Fill and Tidal Wetlands application with existing and proposed plans.

- The Mitigation Plan, page 45, states that once the water level of 2.5' is achieved immediately upstream of the tide gate, the gates will be closed. There may be significant lag time for the desired water level to reach upstream locations. Please address this lag in the final plan.

Long-term Site Management, Protection, and Financial Statement
As noted in the draft Mitigation Plan, the final plan needs to include details of long-term management, provide a site protection instrument (i.e. a deed restriction or conservation easement to prohibit future impacts to the mitigation site in perpetuity), and provide financial assurances to demonstrate there are available resources to support long-term management and permanent site protection.

NDDB Species and Wildlife.
Mitigation activites should not result in loss or take of threatened or endangered species. While it appears that threatened and endangered NDDB plants are not present at the proposed site[3], botanical mapping indicated the threatened freshwater *P.laeve* was found immediately adjacent to the eastern edge of the proposed mitigation site.

- Please discuss potential impacts to threatened and endangered species from the proposed salinity modification.

Mitigation Plan Sheets and Mapping
- In Layout Plans, L-101 to L-103, call out the existing habitat features:
  1. vegetated and non-vegetated areas within the wetland at low tide;
  2. tidal and non-tidal ponds/pools;
  3. tidal and non-tidal creeks and channels;
  4. intertidal flat;
  5. upland islands;
  6. boundaries/extents of Phragmites stands
- Provide a Mitigation Site Map, data and photographs which present baseline conditions of the mitigation wetland, including the flagged wetland boundary extents and the boundaries of all in-wetland features as outlined in 1 through 6 above.

[3] The botanical report indicated the mitigation site survey "was conducted outside of the proper flowering window for most of the target species", therefore additional botanical surveys may need to be performed.

- Should additional mitigation areas be added to the Mitigation Plan, provide a Mitigation Site Map, data, and photographs for each proposed mitigation area that includes delineated features as outlined in 1 through 6 above.

Wetland Impact Mapping

- For the Regulated Resource Impact Area, C-100, provide detail sheets for only the wetland impact areas, including:
  1. bridge details from Proto Drive to the new terminal area; and,
  2. identification of temporary vs. permanent impact areas.

Duplicate Information

LWRD Application Forms C (SDFTWQC) and Form L were designed so there would be no duplicate attachments submitted for the same project. These forms require the Proposed Project (Impact Site) information that is covered in Section 2.1-2.5 of the Mitigation Plan.

- To avoid duplication, the final Mitigation Plan does not need to include this information that is required in the application forms.

ADDITIONAL ITEMS

Structures, Dredging and Fill (SDF) and Tidal Wetlands (TW) Application

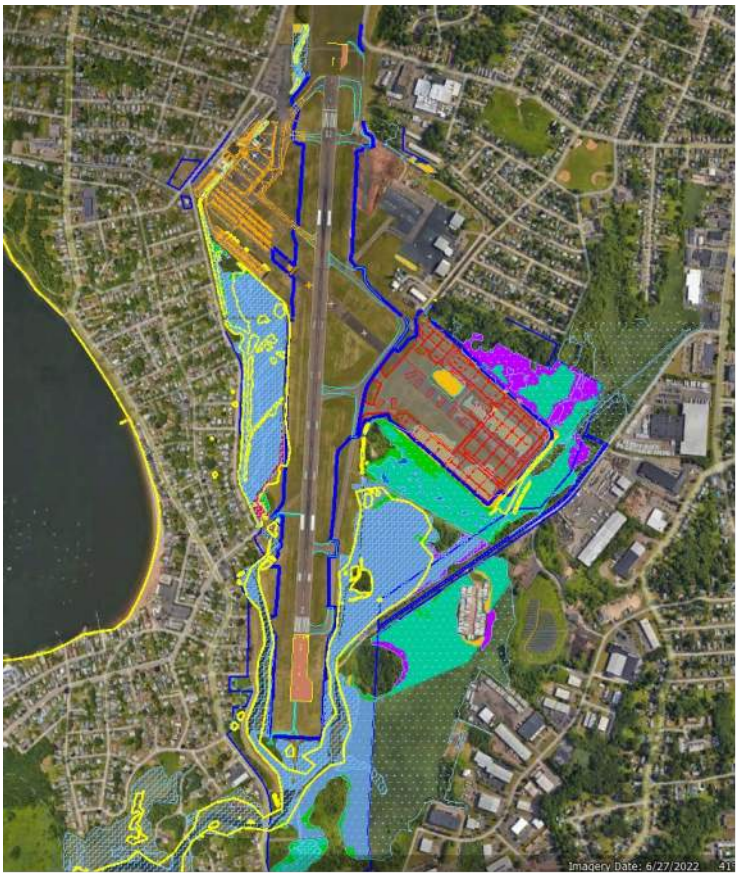
Activities in the proposed impact area will be covered under an Inland Wetland application. However, the required mitigation will occur in a tidal wetland. For this reason, the SDF application being submitted pursuant to Special Terms and Conditions, paragraph 15., of Permit #20003049-KZ, should include a Tidal Wetlands application. Additionally, modification of the tide gates can be covered under the same SDFTW application.

The fee paid for Permit #20003049-KZ covered the prior activities in the Runway 2 safety area. No additional fee for the SDFTW application is required beyond the $660 application fee.

Tidal vs. Inland Wetlands

In an email dated 2/7/25, you responded to my inquiry regarding the tidal wetland boundary. You indicated the yellow boundary in the image below was previously agreed upon and used by Land and Water Resources Division[4] (LWRD) staff. I have consulted with LWRD staff and understand the wetlands north of Pig Farm Road were determined to be Inland Wetlands. I apologize for the confusion.

[4] At the time of the determination, the office/division was called the Office of Long Island Sound Programs.



Pig Farm Road Removal

The removal of historical fill that was placed to create Pig Farm Road would create/restore approximately one acre of tidal wetlands. Fill removal may potentially be used for mitigation credit, but we need to better understand the potential impacts it would have on the upstream system, from both a habitat and flooding perspective. Would removal of the road change FEMA zones?

1. Introduction

This report summarizes tidal water surface elevation and salinity data collected from the Tweed New Haven Airport proposed marsh mitigation areas from July to September 2024. The monitoring was conducted using strategically placed salinity and water level data loggers to evaluate the potential effects of proposed mitigation actions, including increasing tidal exchange and elevating brackish water inundation upstream of the tide gate. The collected data has been analyzed to assess tidal amplitude and salinity variability, with a focus on understanding correlation to tide gate management.

Water surface elevations within the marsh mitigation areas are regulated by a tide gate structure (see Figure 1) located on Morris Creek approximately ¼ mile downstream of the airport. The structure consists of two sluice gates and a flap gate. The tidal cycle in this location ranges from -3.4' NAVD88 at Mean Low Water (MLW) to elevation 2.8 NAVD88 at Mean High Water (MHW). The sluice gates are equipped with automated SCADA and manual remote operations that allow for both advanced and real-time operation of the tide gates.

The tide gate is operated in AUTO Mode during periods of normal operation, and is managed to maintain water surface upstream of the tide gate at or below 2.0 feet NAVD88, as measured at a sensor immediately upstream of the tide gate structure. The tide gates are operated in WATERSHED DRAIN Mode in advance of a storm event to preemptively avoid flooding in the Morris Creek area. Under Watershed Drain Mode, the sluice gates are opened up to 48 hours in advance of the storm to allow the marsh to drain. The sluice gates are then closed before the next tidal cycle begins to prevent seawater from flowing upstream into the creek.

Figure 1: Tide Gate Structure

2. Data Collection

A total of seven (7) YSI EXO 1 sonde probes (data loggers) were installed by EDD staff at seven locations throughout the proposed Mitigation Wetland areas. The loggers were deployed at the locations shown in Figure 3 from July 12 to August 27, 2024.

The data loggers were located to capture the gradient of salinity and inundation conditions along the hydrological gradient of the marsh, ensuring comprehensive data collection across varying distances upstream from the tide gate. Data loggers were deployed to record salinity (in parts per thousand) and water surface elevation (in feet NAVD88) at 15-minute intervals.

Figure 2: Experimentation Setup: Data Logger and Sonde Enclosure

The data loggers were installed as described below:

Table 1
Data Logger Location Description

Data Logger	Location Description
SM-1	Positioned along the primary tidal channel at the lower boundary of the marsh. This location is within a direct path of tidal influence, capturing the salinity and water level immediately affected by the tide gate's operation.
SM-2	Situated midway along the tidal channel, this logger captures the gradient where tidal influence begins to wane, and freshwater influence becomes more evident.
SM-3	Placed at the heart of the marsh system, SM-3 provides data on the hydrological and salinity conditions within a region dominated by dense Phragmites australis stands. This central location also captures the effects of reduced tidal flushing as water moves further from the tide gate.
SM-4	This location is at the upstream edge of the mitigation site where tidal influence is weakest. The area is characterized by significant freshwater input and is often dominated by freshwater vegetation such as Phragmites.

SM-5	Positioned near a key hydrological structure (culvert), SM-5 captures data on the interaction between tidal and stormwater flows.
SM-6	Relocated downstream to location A between former location SM-5 and SM-6, renamed SM-6A
SM-7	This logger is located at the southernmost boundary of the marsh system. The area is distant from both the primary tidal channel and the tide gate.

Raw data consisting of timestamped readings of salinity and water surface elevation was downloaded from the dataloggers. The data was plotted over time to examine trends between the logger locations relative to the tide gate. Data was adjusted to remove outliers and periods of missing data. Data collection results are included in Section 3. Results.

Figure 3: Data Logger Location Plan

The locations of several data loggers were adjusted to capture water level and salinity variation within identified stands of *Spartina alterniflora*, as shown in Figure 4. A second series of data was collected with the data loggers in the post-relocation locations. The data loggers were deployed in the relocated locations from August 28th through September 20th, 2024. The following adjustments were made to the data logger locations:

Table 2
Data Logger Location Adjustments

Data Logger	Adjustment
SM-1	Removed
SM-2	Removed
SM-3	Relocated to Spartina stand C near former location of SM-1, renamed SM-3C
SM-4	Relocated to Spartina stand B near the Tuttle Brook junction, renamed SM-4B
SM-5	Removed
SM-6	Relocated downstream to location A between former location SM-5 and SM-6, renamed SM-6A
SM-7	Kept in place

Figure 4: Relocated Data Logger Location Plan

3. Results

3.1 Pre-Relocation Results

3.1.1 Pre-Relocation Elevation

Water surface elevations from July 24 – 27, 2024 were analyzed to determine the peak water surface elevations experienced within the proposed mitigation marsh area. This period of data provides a representative snapshot of the impact of the normal operational procedure on water surface elevations at the monitored locations, refer to Figure 6.

The data indicate that water surface elevations within the proposed marsh mitigation areas are managed to stay at or below elevation 2.0 feet NAVD88 during periods of normal operation. Average peak water surface elevations are given in Table 3.

Table 3
Pre-Relocation Peak Elevation
(feet, NAVD88)

ID	Location	Peak Elevation (feet, NAVD88)
SM-1	Lower boundary of Marsh along main tidal channel	1.94
SM-2	Midway along NE tidal channel	1.74
SM-3	At heart of NE marsh within Phrag stand	1.21
SM-4	Upstream end of NE marsh in mitigation site	1.77
SM-5	At culvert leading to NW marsh	1.80
SM-6	In ditch at head of NW wetland	1.70
SM-7	Within Phrag stand in NW wetland	1.67

As expected, the highest peak water surface elevations were observed at SM-1. This location also peaked first. As SM-1 is located the furthest downstream, it is expected that the water surface would peak and recede here more quickly than at the other locations. The lowest peak water surface elevations were observed at SM-3, which could be indicative of the lack of penetration of the tidal column into the dense stand of phragmites where SM-3 was located. Similarly, peak water surface elevations at SM-7 were lower than those at the surrounding gages; SM-7 was also located within a stand of Phragmites, although not as deeply within the stand as SM-3. This is further indicative that the tidal column is not able to fully penetrate into the dense stands of *Phragmites* present at the site.

Peak water surface elevations varied by a less than four (4) inches between all locations. Water surface elevations peak in the following chronological order, and are separated between approximately 10 minutes between groups: SM1, SM-2 and SM-6, SM-3 and SM-4, SM-5, and SM-7. The average peak water surface elevations and the time to peak follow the trend that downstream gages peak first and highest, with upstream gages peaking later and to lower elevations. The exception to this trend is observed at SM-6, where the peak water surface elevations are similar to those observed at SM-2, despite the fact that SM-6 is located significantly upstream from the location of SM-2. This is believed to be due to the influence of freshwater inputs at SM-6.

While water surface elevations peak concurrently at SM-3 and SM-4, the elevations at SM-3 are generally two (2) inches lower than those recorded at SM-4. This could indicate that the tidal plume is not fully penetrating into the dense stands of *Phragmites* where SM-3 is located.

Similarly, water surface elevations concurrently peak at SM-2 and SM-6. This could be due to the lack of obstructions along the tidal channel to SM-2 and constructed tidal ditches leading to SM-6 that allow for easy upstream migration of the tidal plume. Water surface elevations at SM-2 were observed to peak approximately 2.5 inches below those observed at SM-6. This is likely due to the fact that SM-6 is located approximately a quarter of a mile upstream at a higher elevation, and experiences freshwater inputs. Note that the results are provided as absolute elevation and not water depth.

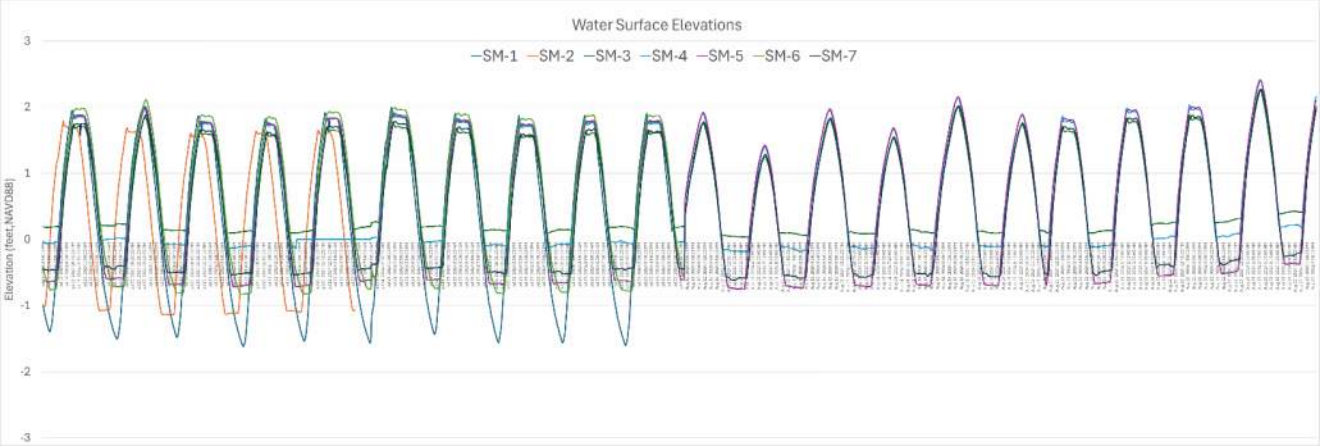

Figure 5: Pre-Relocation Elevation (NAVD88): July 19, 2024 to August 23, 2024

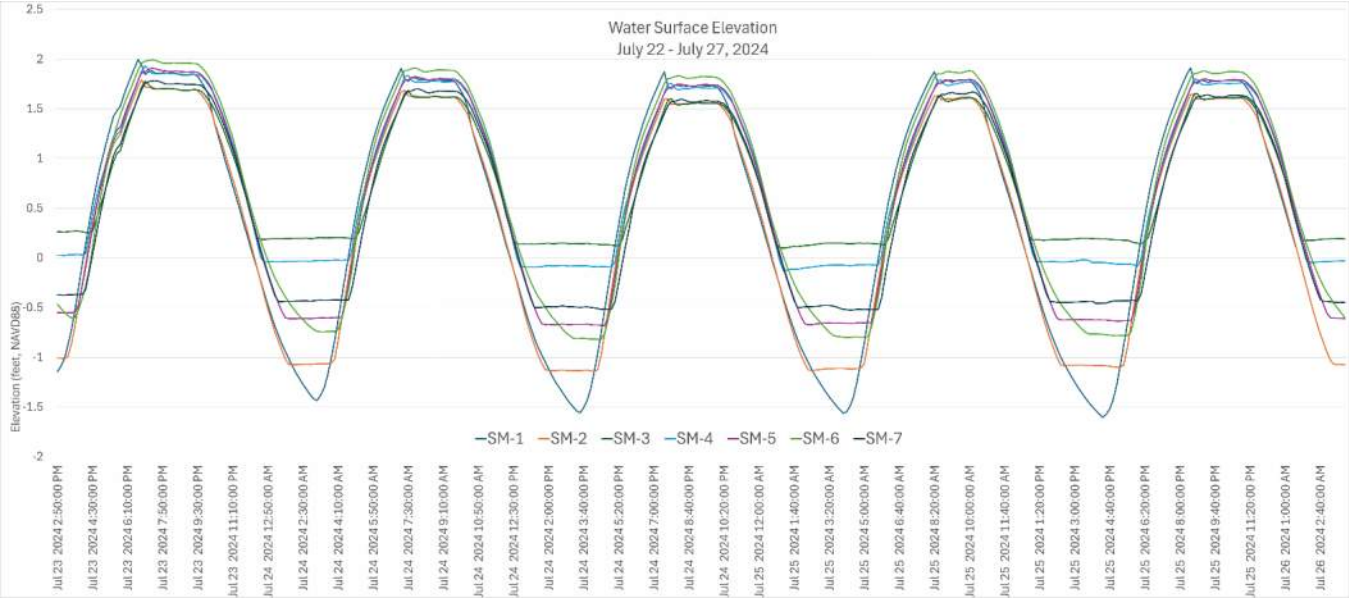

Figure 6: Pre-Relocation Tidal Water Surface Elevations, July 22, 2024 to July 27, 2024

The data loggers captured an event on July 24th in which the airport tide gate operator neglected to close the tide gates at the correct time, resulting in the data loggers catching the full range of the tidal cycle. This is shown toward the lefthand side of the chart in Figure 4.

A representative snapshot of the tidal cycle from July 25, 2024 is shown in Figure 7. The differences in peak water surface elevation, peak duration, and recession between the data locations are more clearly visible in this figure.

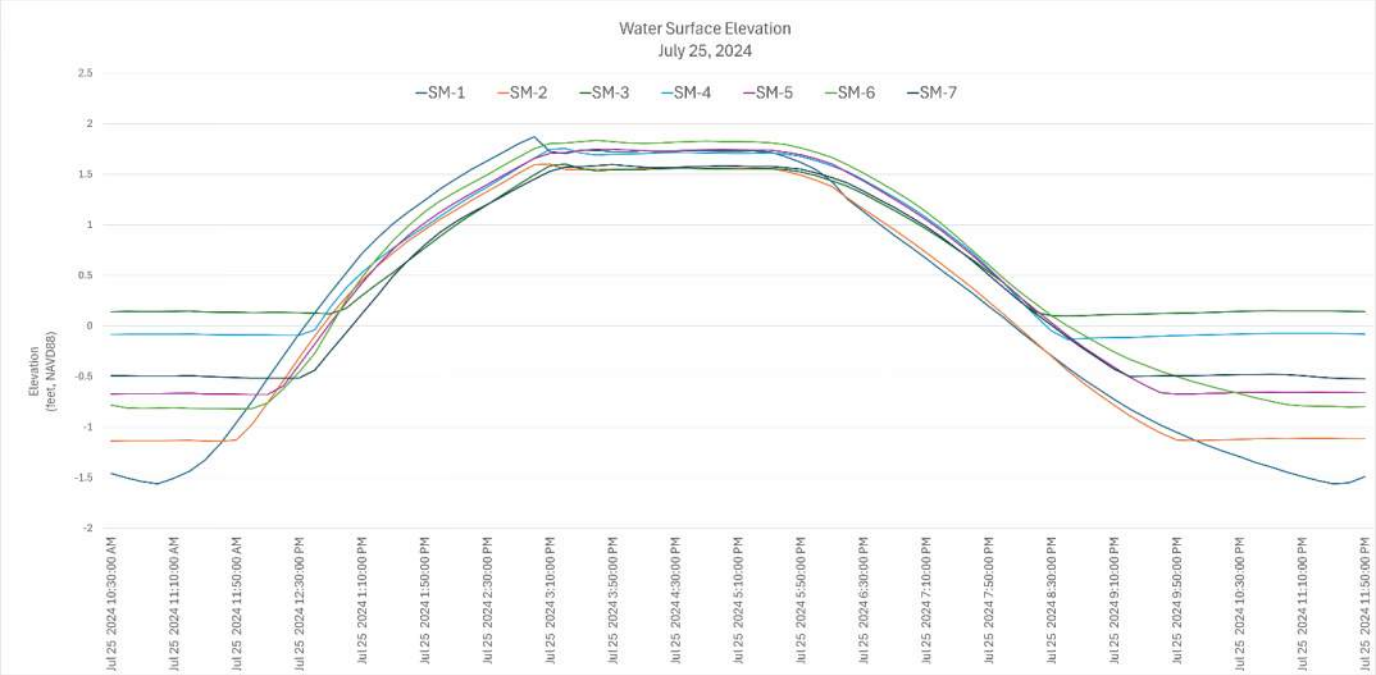

Figure 7: Pre-Relocation Tidal Water Surface Elevations, July 25, 2024

3.1.2 Pre-Relocation Salinity

The observed salinities were within the range expected for near-ocean tidal marsh system. The average peak salinity values ranged from 22.18 at SM-1 to 25.04 ppt at SM-5, refer to Table 4 and Figure 8. These salt marsh areas experience regular tidal flushing, making salinity levels close to that of seawater. Evidence of freshwater mixing was observed at SM-6, where average peak salinity values reach only 3.01 ppt. When this gage was moved a short distance downstream to location 6A, the observed peak salinities were in line with those observed at the other locations.

Table 4
Pre-Relocation
Average Peak Salinity (ppt)

Data Logger	Average Peak Salinity (ppt)
SM-1	22.18
SM-2	22.89
SM-3	24.99
SM-4	24.69
SM-5	25.04
SM-6	3.01
SM-7	23.20

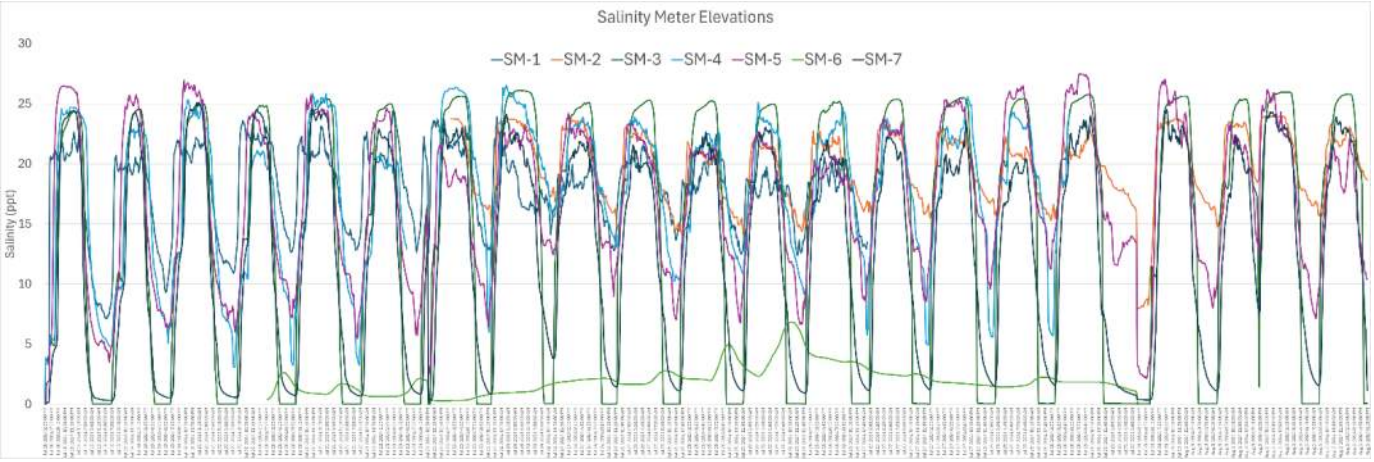

Figure 8: Pre-Relocation Salinity (ppt): July 18,2024 to August 3, 2024

3.2 Post-Relocation Results

3.2.1 Post-Relocation Elevation

The data loggers were moved to the locations shown in Figure 4 on September 18, 2024 to capture variations in water levels within the existing stands of *Spartina alterniflora* within the proposed mitigation marsh areas. Peak water surface elevations were again recorded following relocation of the data loggers, as shown in Figure 9. As with the first set of data, the peak water surface elevations are generally managed to be at or below elevation 2.0 feet NAVD88. The post-relocation average peak water surface elevations are given in Table 5. Note that the peak water surface elevations only reach and stay above elevation 2.0 feet NAVD for short periods of time, with a maximum of 2 hours spent above elevation 2.0 feet NAVD. The peak water surface elevations rarely reach elevation 2.5 feet NAVD.

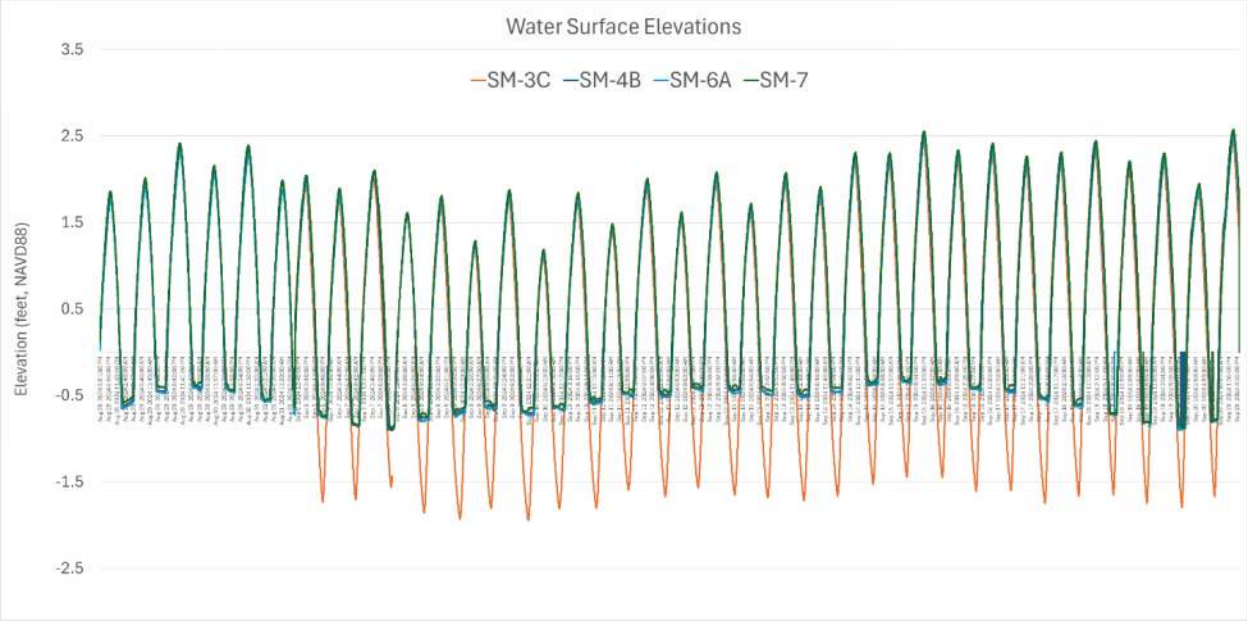

Figure 9: Post-Relocation Elevation, August 28 – September 20, 2024

Following relocation, the highest water surface elevations are observed at SM-4 and SM-7, which peak concurrently at an observed peak water surface at elevation of 1.98 feet NAVD88. Average peak water surface elevations are on average two (2) inches lower at SM-3C and one (1) inch lower at SM-6A than those observed at SM-4B and SM-7. Sample locations SM-4B and SM-7 are located further upstream than SM-6 and SM-2. These results appear to indicate the impact of the wetland longitudinal profile on the observed water surface elevations within the marsh system. The results indicate that the tidal prism is not fully extending to the upstream extents of the marsh as managed under normal operational procedure.

Table 5
Post-Relocation
Average Peak Elevation
(feet, NAVD88)

ID	Location	Avg. Peak Elevation (feet, NAVD88)
SM-3C	Lower boundary of Marsh along main tidal channel, within *Spartina* stand	1.83
SM-4B	Upstream end of NE marsh within *Spartina* stand	1.98
SM-6A	In ditch at head of NW wetland, midway between former SM-5 and SM-6	1.91
SM-7	Within *Phragmites* stand in NW wetland	1.98

3.2.2 Post-Relocation Salinity

Salinity levels recorded during the second monitoring event were generally higher than those from the first event, approaching values typical of seawater. Peak salinities at SM-6A and SM-7 were lower compared to SM-3C and SM-4B, which were situated within *Spartina alterniflora* stands. This pattern indicates that salinity levels are higher in *Spartina*-dominated areas than in locations influenced by freshwater inputs. Although the observed increase in salinity is relatively minor, it appears sufficient to support the growth of *Spartina alterniflora* over *Phragmites australis*.

Table 6
Post-Relocation
Average Peak Salinity (ppt)

Data Logger	Average Peak Salinity (ppt)
SM-3C	26.13
SM-4B	25.99
SM-6A	25.48
SM-7	25.01

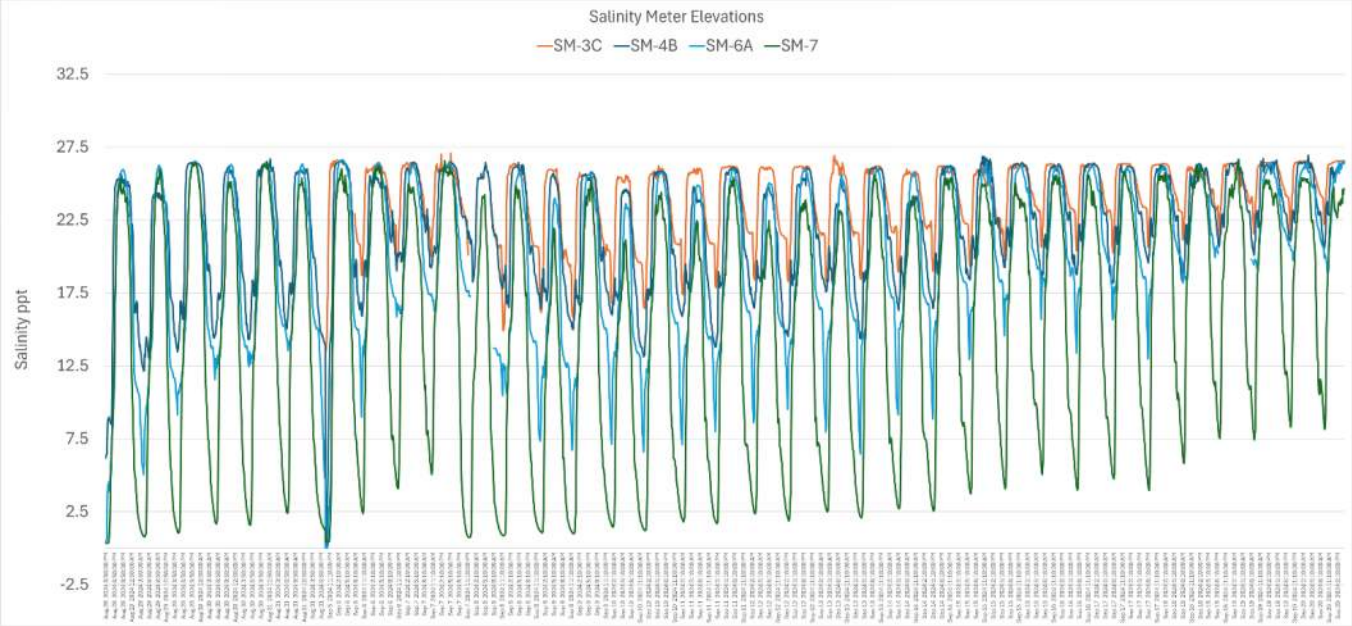

Figure 10: Post-Relocation Salinity (ppt): August 28, 2024 to September 20, 2024

4. Proposed Inundation Duration

The collected data was analyzed to determine the depth and duration of inundation in both the *Phragmites australis* and *Spartina alterniflora* dominated areas. The *Spartina alterniflora* at the site was observed to be growing at and below elevation 0.6 feet NAVD, based on field survey and observation. The average duration of inundation at elevation 0.6 feet was determined to be 6 hours from the tidal water surface elevation data.

The proposed Mitigation Plan will increase the peak elevation of inundation within the proposed marsh mitigation area wetlands to 2.5 feet NAVD. This elevation was determined as the maximum elevation of inundation allowed at the airport to retain the integrity of safety areas at the runway termini. The collected data indicate that water surface elevations rarely exceed elevation 2.5' NAVD within the proposed marsh mitigation area. When the water surface elevations do exceed this elevation, the average duration of inundation is approximately ½ hour.

Table 7
Existing Conditions Inundation Duration

Elevation (feet, NAVD88)	Inundation Duration (hours)
0.6 (*Spartina alterniflora*)	6
2.5 (*Phragmites australis*)	0.5

5. Conclusion

The results indicate the following:

- Water surface elevation within the proposed marsh mitigation areas are currently managed to stay at or below elevation 2.0 feet NAVD88 during periods of normal operation.
- The tidal column does not appear to fully penetrate into the dense stands of *Phragmites* within the marsh mitigation areas, limiting the benefits of tidal exchange in these areas. The presence of *Phragmites* appears to limit tidal flushing effectiveness, creating ecological zones with reduced salinity and less frequent inundation.
- The tidal prism does not always fully extend to the upstream extents of the marsh as managed under normal operational procedure, suggesting that the current operational procedures limit the tidal prism's reach
- Freshwater input is lowering salinities in the upper region of the northwest marsh.
- The proposed inundation duration at elevation 2.5 feet NAVD88 is 6 hours, to match the current duration of inundation experienced in thriving *Spartina alterniflora* areas.

BSC GROUP

MEMORANDUM

BACKGROUND INFO

Project Name: Tweed Airport Tidal Gate Project
Permit #(s): NDDB Filing # 117005
Project Location: NDDB State-listed species areas on Tweed Airport property at 20 Thompson St. New Haven, CT. Survey area is 32.5 acres.

Scope of Work or Purpose for Survey:

- Tweed Airport is proposing a change to Tidal Gate operations that will affect water levels in the surrounding tidal marsh of Morris Creek. The survey was conducted to identify targeted rare plant species (Table 1) in the areas where tidal levels will be altered, and to assess if suitable habitat is present for these species.

Table 1. Summary of State-Mapped Rare Species Habitat & Target Survey Areas

2024 Survey Date	Botanists	Target Species	Weather	Survey Duration (Total Person Hours)	Summary Survey Results
October 16 - 17	T. Groves and J. Kuziel	• *Krigia biflora* • *Plantago virginica* • *Cirsium horridulum* • *Paspalum laeve* • *Leptochloa fusc* ssp. *fascicularis* • *Pedicularis lanceolata* • *Liatris novae-angliae*	Mostly sunny, temperatures in the 60s ºF	32 person-hours	No Target Species Observed

*Common names provided in Table 3.

SURVEY PROTOCOL

Survey Methods:

Meander-based surveys within areas projected to experience increased water levels due to changes in tidal gate operations. Survey assessed likelihood of occurrence for rare species based on habitat assessment and survey for target species.

Target Survey Areas:

32.5 acres of Tweed Airport property located in the tidal marsh surrounding the airfield at 20 Thompson Ave. New Haven, CT. The survey area was subdivided into 16 sections determined by distinct polygons. Individual units are labeled PP (Phragmites Patch) and a unique identification number (1 - 16). Maps of the survey units are provided in Attachment A.

Target Species:

See Table 1.

SURVEY RESULTS

General Site Characteristics

Tweed Airport is an open, managed, sandplain/wet meadow surrounded by tidal marsh. In use as an airport since the 1940s, this site has likely undergone many changes to vegetative composition over the decades. Much of the area in the center of the property where mowing occurs most frequently, is

primarily non-native grasses and non-native herbaceous cover. The 32.5 acre survey area that comprised the Tidal Gate part of the project identified and surveyed areas outside of the managed part of the airport in the surrounding tidal marsh wetlands. These areas will experience an increase in brackish water and are largely dominated by common reed (*Phragmites australis*).

Summary of Results

Tidal Gate survey areas were divided into 16 units individually labeled as "PP 1-16", details on each individual locations are provided in the provided mapping (Attachment A).

During the Tidal Gate botanical surveys, 50 plant species were observed, 81.25% were native (39 species) and 18.75% (11 species) were non-native or invasive. Although there were more native species, these species comprised only a small fraction of the vegetative community observed during the survey. Common reed (*Phragmites australis*) dominates the available habitat in the Tidal Gate survey area and comprises an estimated 98% of the vegetation present. A complete species list is presented in Attachment B, Table 3.

Included with the target species surveys was an assessment of potential habitats in select locations for the threatened, endangered, or special concern species listed in Table 1. This assessment was based on observed vegetative community, available habitat and invasive species density. Table 2 below lists the dominant and non-dominant plant species observed at each survey location. Representative photos from each survey unit are presented in Attachment C.

Table 2. Tidal Gate Survey Locations and Descriptions

Location	Dominant Vegetation	Non-Dominant Vegetation
PP1	common reed (*Phragmites australis)*	climbing hempvine (*Mikania* scandens) multiflora rose (*Rosa multiflora*) poison ivy (*Toxicodendron radicans),* saltmarsh cordgrass (*Sporobolus alternifolorus*) Callery pear (*Pyrus calleryana*) small white aster (*Symphyotrichum racemosum*)
PP2	common reed (*Phragmites australis*)	climbing hempvine (*Mikania scandens)* poison ivy (*Toxicodendron radicans*) sawbrier (*Smilax glauca*) blackberry (*Rubus* ssp.) multiflora rose (*Rosa multiflora*)
PP3	common reed (*Phragmites australis*)	multiflora rose (*Rosa multiflora*) honeysuckle (*Lonicera* ssp.) groundsel tree (*Baccharis halimifolia*)
PP4	common reed (*Phragmites australis*)	groundsel tree (*Baccharis halimifolia*)
PP5	common reed (*Phragmites australis*)	spartina grass (*Sporobolus alterniflorus*) groundsel tree (*Baccharis halimifolia*)
PP6	common reed (*Phragmites australis*)	spartina grass (*Sporobolus alterniflorus*)
PP7	common reed (*Phragmites*	spartina grass (*Sporobolus alterniflorus*)

	australis)	groundsel tree (*Baccharis halimifolia*)
PP8	common reed (*Phragmites australis*)	fat-hen (*Atriplex prostrata*) saltgrass (*Distichlis spicata*) saltmeadow rush (*Juncus gerardii*) groundsel tree (*Baccharis halimifolia*) Carolina sea-lavender (*Limonium carolinianum*) Virginia glasswort (*Salicornia depressa*)
PP9	common reed (*Phragmites australis*)	spartina grass (*Sporobolus alterniflorus*)
PP10	common reed (*Phragmites australis*)	groundsel tree (*Baccharis halimifolia*) showy goldenrod (*Solidago speciosa*) Oriental bittersweet (*Celastrus orbiculatus*) autumn olive (*Elaeagnus umbellata*)
PP11	common reed (*Phragmites australis*)	N/A

PP14	common reed (*Phragmites australis*)	N/A
PP15	common reed (*Phragmites australis*)	N/A
PP16	common reed (*Phragmites australis*)	N/A

Summary of Survey results

No target species were observed in the Tidal Gate survey locations during the October 2024 surveys. Due to the moderate to heavy density of common reed in the survey areas, the habitat in these areas is unsuitable for any of the target species.

Observations of the cover type during the survey indicate that areas to be impacted by tidal changes are currently 98% or more infested by common reed. Areas already experiencing more frequent tidal influence currently are comprised of 99% saltmarsh cordgrass (*Sporobolus alterniflorus*). The areas currently experiencing consistent tidal influence only comprise a small percentage of the total area.

Summary of Invasive Plant Species

Invasive species present that are either in very high densities or very low densities with high threat of spread are common reed (*Phragmites australis)*, Oriental bittersweet (*Celastrus orbiculatus),*

multiflora rose (*Rosa* multiflora), purple loosestrife (*Lythrum* salicaria), and pale swallowwort (*Cynanchum rossicum*). Other non-native/invasive species observed during the surveys included Callery pear (*Pyrus calleryana*), and creeping thistle (*Cirsium arvense*). Interestingly a newer non-native species, bog bulrush (*Schoenoplectiella mucronata)* was observed in the survey area and is not present in the herbarium records for New England. The closest current occurrence is from across Long Island Sound on Long Island, NY. This could represent a new non-native, potentially invasive species moving into New England.

Other Comments/Notes:

Two congener species were observed for one target species, yellow thistle (*Cirsium horridulum*).

Congeners for yellow thistle:

- *Cirsium arvense* (creeping thistle)
- *Cirsium vulgare* (bull thistle)

These similar species were distinguished from the target species by the presence of purple flowers, and capitula not closely invested by a series of narrow, spiny-marginated leaves that form a false involucre (Appendix C).

No other congener for target species was observed.

Within the survey area, habitat suitability for any of the target species was very low. Overall, the survey areas are dominated by dense, tall thickets of common reed with little available space for any other vegetation to grow. In areas that did have a native species component, the species present only made up a fraction of a percent of the total vegetation, unless it was below the elevation of the target areas and was currently experiencing water infiltration; these areas were dominated by saltmarsh cordgrass. As a note and anecdotal observation, upland areas outside the tidal marsh survey area had many more native species, contained 90% or more native plant species by area, and were generally typical of a dry oak, hickory forest.

Species Protection Measures

N/A – No target species observations or potential habitat.

Target Species – Table of Identifying Characteristics

Tables of Observed Native and Non-Native Species

State Common Species Name	Species Name (binomial)	Listing Status: State	Listing Status: Federal	Ideal/ Target Survey Window	Target Survey Effort	Ideal Habitat	Key Features for Identification & Survey Target Windows
Yellow thistle	*Cirsium horridulum*	E	N/A	June – July	October 15 – 16, 2024	Coastal grasslands; airports; open-canopy trailsides and roadsides, inner salt marsh borders; Juniperus-Panicum virgatum communities, scrub communities, and forest edges bordering salt marshes	▪ Neither the stem nor the branches with decurrent wings. ▪ Involucre 20 – 50 mm tall, with bisexual flowers with reproductive stem arising from a rosette of leaves. ▪ Capitula closely invested by a series of narrow, spiny-margined leaves that form a false involucre sometimes overtopping the true involucre, corollas yellow.
Two-flowered cynthia	*Krigia biflora*	T	N/A	June	October 15 – 16, 2024	Dry to wet meadows, fields, rocky woods, and roadsides	▪ Pappus of 10 inconspicuous, hyaline scales and 20 – 35 longer, slender bristles; involucre 7 – 14 mm tall; basal leaf blades 10 – 50 mm wide, glabrous; plants perennial from a short caudex.
Hoary plantain	*Plantago virginica*	SC	N/A	May - June	October 15 – 16, 2024	Dry uplands disturbed areas.	▪ Entire, basal leaf blades only, linear to ovate with peduncles arising among basal rosettes of leaves. ▪ Bracts and/or sepals conspicuously pubescent; plants monocarpic. ▪ Plants sub-dioecious; lobes of the corolla of carpel bearing, chasmogamous flowers erect after anthesis, fruits oblanceolate to obovate.
Saltpond grass	*Leptochloa fusca ssp. fascicularis*	E	N/A	August - November	October 15 – 16, 2024	Coastal, in brackish ponds and shores of "salt ponds", borders of salt or brackish marshes, sand depressions in coastal grasslands and sandy	▪ Leaf sheaths glabrous or scabrous, but not pustulous pubescent; ligule 2 – 8 mm long, attenuate at the apex and becoming

						roadsides.	lacerate at maturity spikelets 5 – 12 mm long, with 6 – 20 florets.
Field paspalum	*Paspalum laeve*	T	N/A	August – October	October 15 – 16, 2024	Mostly coastal, hydric to moderately well-drained fields, meadows, grasslands, floodplain grasslands and meadows, thickets and shores, seasonally flooded and exposed open-canopy vernal pools. ROWs and airports near the coast.	▪ Spikelets 2.3 – 3.3 mm long, solitary at each node, ligules 1.5 – 3.8 mm long
swamp lousewort	*Pedicularis lanceolata*	T	N/A	August - September	October 15 – 16, 2024	Open areas that are periodically flooded such as wet meadows, marsh edges, and stream banks. Usually on calcareous soils but also in non-calcareous wetlands in CT.	▪ The hairless or nearly hairless stem grows from 9 inches to 3 feet tall and usually occurs singly. Leave are 2 – 4 inches long, stalkless or short-stalked, and mostly opposite, pinnately lobed, lanceolate, with the sinuses extending less than halfway back to the midrib. Flowers are 15 – 25mm long, pale yellow, and occur in a crowded spike.
New England blazing star	*Liatris novae-angliae*	SC	N/A	August – October	October 15 – 16, 2024	Open, dry, low-nutrient sandy soils of grasslands, heathlands, and barrens. Prefers fire-influenced natural communities that are periodically disturbed and devoid of dense woody plant cover.	▪ Grows up to 2.6 feet tall and has numerous alternate, entire, and very narrow stem leaves (0.4 – 2 inches). Flowers are purple and are borne in heads, generally with 3 – 30 heads per plant. The heads are hemispheric in shape, and have stalks that range in length from very short to about 2 inches. Flower heads have 20 – 80 flowers.

Table 3. Non-Native/Invasive Plant Species Survey Inventory

Scientific Name	Common Name
Amorpha fruticosa	false indigo-bush
Artemesia ssp.	mugwort
Cirsium arvense	creeping thistle
Cirsium vulgare	bull thistle
Cynanchum rossicum	pale swallowwort
Elaeagnus umbellata	autumn olive
Helianthus giganteus	giant sunflower
Lonicera ssp.	honeysuckles
Lythrum salicaria	purple loosestrife
Phragmites australis	common reed
Pyrus calleryana	Callery pear

Table 4. Native Plant Species Survey Inventory

Scientific Name	Common name
Atriplex prostrata	fat-hen
Baccharis halimifolia	groundsel tree
Betula populifolia	gray birch
Carex comosa	bristly sedge
Carex intumescens	bladder sedge
Carex pellita	woolly sedge
Clethera alnifolia	sweet pepperbush
Distichlis spicata	saltgrass
Eleocharis obtusa	blunt spikesedge
Elymus virginicus	Virginia wildrye
Hibiscus moscheutos	swamp rose mallow
Ilex verticillata	winterberry holly
Juiperus virginiana	eastern redcedar
Juncus gerardi	saltmeadow rush
Juncus tenuis	slender path rush
Limonium carolinianum	Carolina sea-lavender
Mikania scandens	climbing hemp vine
Morella pensylvanica	northern bayberry
Nyssa sylvatica	black tupelo
Panicum virgatum	switch panicgrass
Pluchea odorata	sweet-scented camphorweed
Quercus alba	white oak
Quercus palustris	pin oak
Rhus copallinum	shining sumac
Rubus ssp.	blackberry

Scientific Name	Common name
Salicornia depressa	Virginia glasswort
Schoenoplectis tabernaemontani	soft-stemmed bulrush
Smilax glauca	sawbrier
Solidago graminifolia	grass leaved goldenrod
Solidago sempervirens	seaside goldenrod
Solidago speciosa	showy goldenrod
Sporobolus alterniflorus	saltmarsh cordgrass
Sporobolus pumilus	marsh hay cordgrass
Symphyotrichum racemosum	small white aster
Symphyotrichum subulatum	annual saltmarsh aster
Symphyotrichum tenuifolium	perennial saltmarsh aster
Toxicodendron radicans	poison ivy
Urtica dioica	stinging nettle
Viburnum dentatum	smooth arrowwood

ATTACHMENT C

Photo Pages

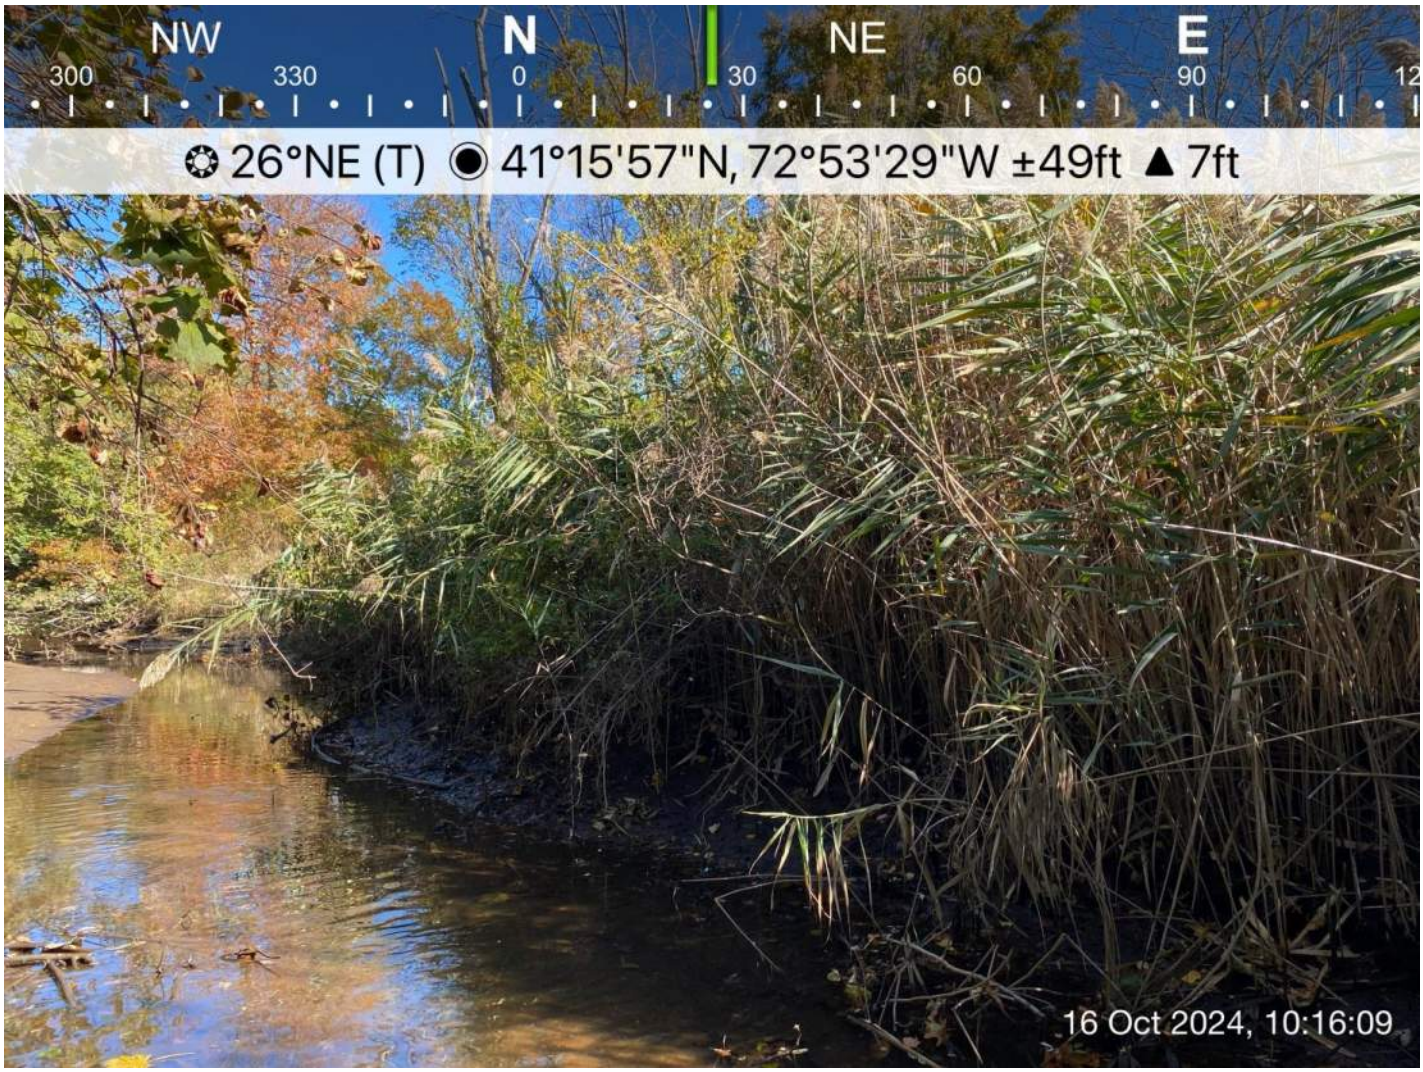

Photo 1: Survey Area PP1 – High density *Phragmites australis* making up 90%+ of the vegetation in this unit.

Photo 2: Survey Area PP3 - An aerial view from a standing dead tree over area PP3. For reference, these *Phragmites australis* stems were ~12 – 15’ tall.

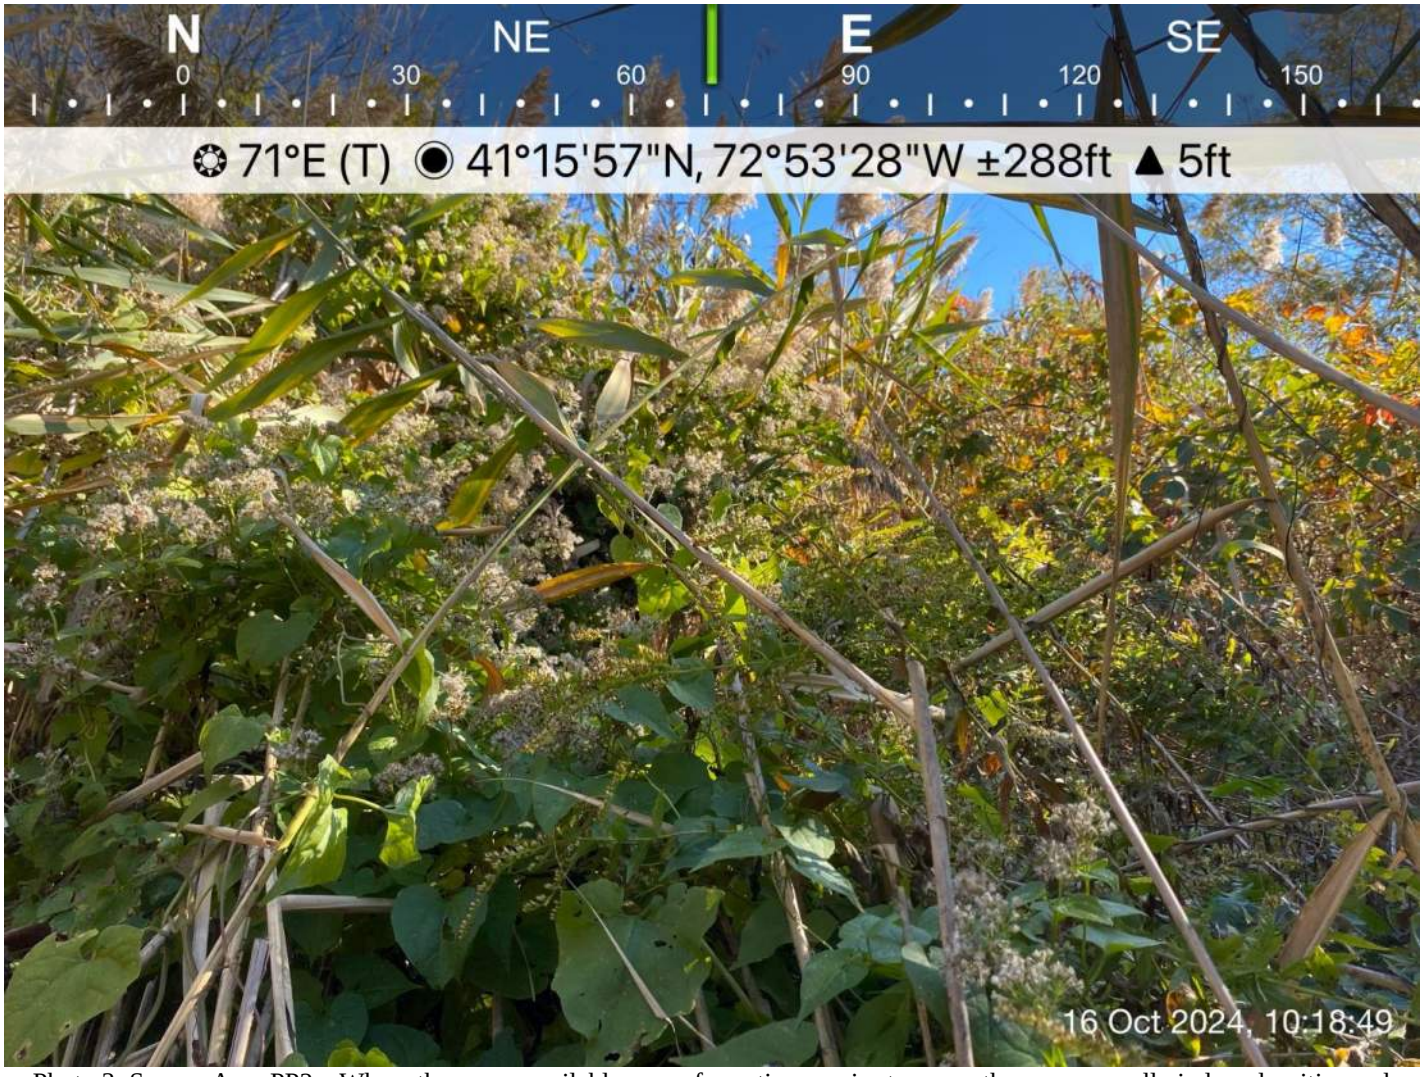

Photo 3: Survey Area PP2 – Where there was available space for native species to grow, they were usually in low densities and struggling for resources. Depicted here is climbing hemp vine (*Mikania scandens*) observed growing up common reed stems.

Photo 4: Survey Area PP4 – An example of a less dense population of *Phragmites australis* this type of reduction in density was associated with higher levels of tidal influence.

Photo 5: Survey Area PP5 – Occasionally during the survey we would find an open patch of saltmarsh cordgrass. When these areas were observed and common reed wasn't the other species present, saltmarsh cordgrass was in high densities.

Photo 6: Survey Area PP6 – An inner patch of saltmarsh cord grass. In this location the areas defined by the native species were a few inches deep with water. Common reed dominated areas were slightly drier. Additionally, the common reed in this area is slightly younger, and is potentially a newer invader in this specific area.

Photo 7: Survey Area PP7 – The area closest to the waters edge had mostly saltmarsh cordgrass while the interior of the area east to the airfield had primarily common reed, with some scattered populations of groundsel tree.

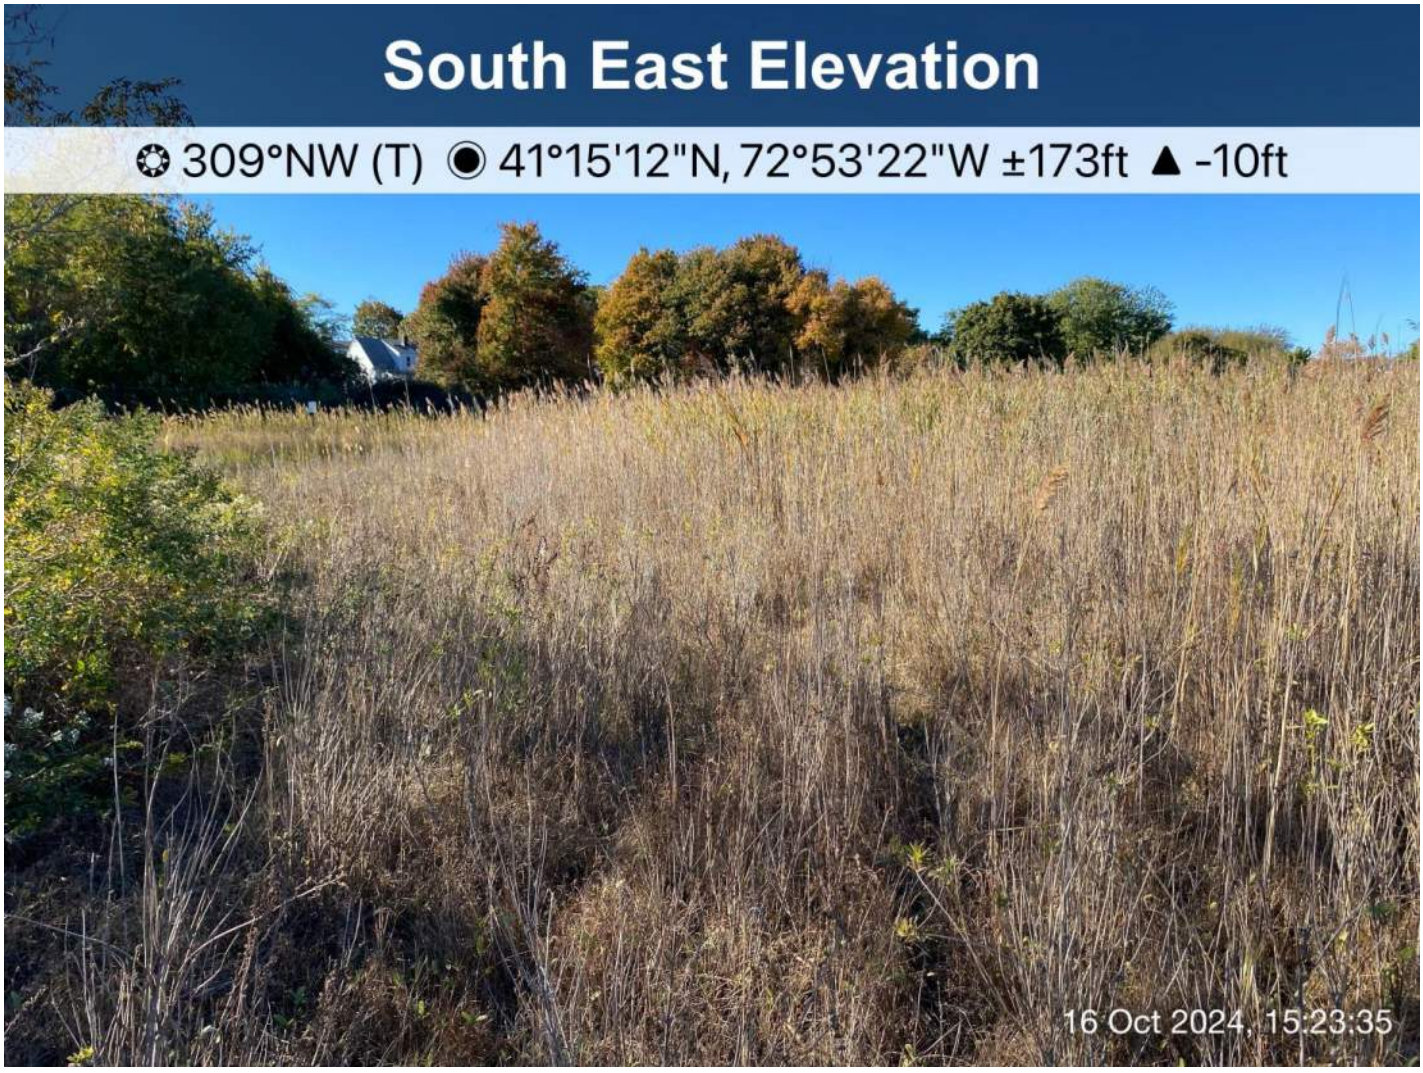

Photo 8: Survey Area PP8 – This area had a greater mix of biodiversity present. The areas closest to the upland edge of the unit was less infested with common reed and was comprised of perennial saltmarsh aster (*Symphyotrichum tenuifolium*), salt grass (*Distichlis spicata*), saltmarsh sand spurry (*Spergularia marina*), glasswort (*Salicornia depressa*) and Carolina sea lavender (*Limonium carolinianum*).

Photo 9: Survey Area PP9 – On the northwest side of Morris Creek near the Tidal Gate off Cart Rd. In areas with more tidal influence, vegetation transitions from 100% invasive common reed to 100% saltmarsh cordgrass.

Photo 10: Survey Area PP9 – A similar vegetative community exists on the eastern side of Morris Creek.

Photo 11: Survey Area PP10 – An overview photo of the only native plant location in the unit. Other invasive species in this location and along the fence line are oriental bittersweet, bush honeysuckle, mugwort, and Japanese knotweed.

Photo 12: Survey Area PP11 – A narrow strip between the airfield and Morris Creek was primarily common reed with few other species observed.

Photo 13: Survey Area PP12 – A common reed inundated area with an upland island in the background. The upland area outside of area PP12 had a relatively intact community of native species.

Photo 14: Survey Area PP13 – This area was comprised of mostly common reed with scattered patches of saltmarsh cordgrass. In the upland areas surrounding this zone, there were pin oak, white oak, and black gum observed.

Photo 15: Survey Area PP14 – Depicted in this photo is a dense, tall, monoculture of common reed with standing water at the center of the unit. It is additionally noted that upland areas adjacent to this survey area had native species representative of a more natural vegetative community where black gum present (*Nyssa sylvatica*).

Photo 16: Survey Area PP15 – Another saltmarsh cordgrass location found within a surrounding monoculture of common reed.

Photo 17: Survey Area PP17 – An observation of a non-native species with few other historic New England observations. *Schoenoplectiella mucronata* is a plant species native to Eurasia, Africa and Australia with the closest recent observations on Long Island, NY.

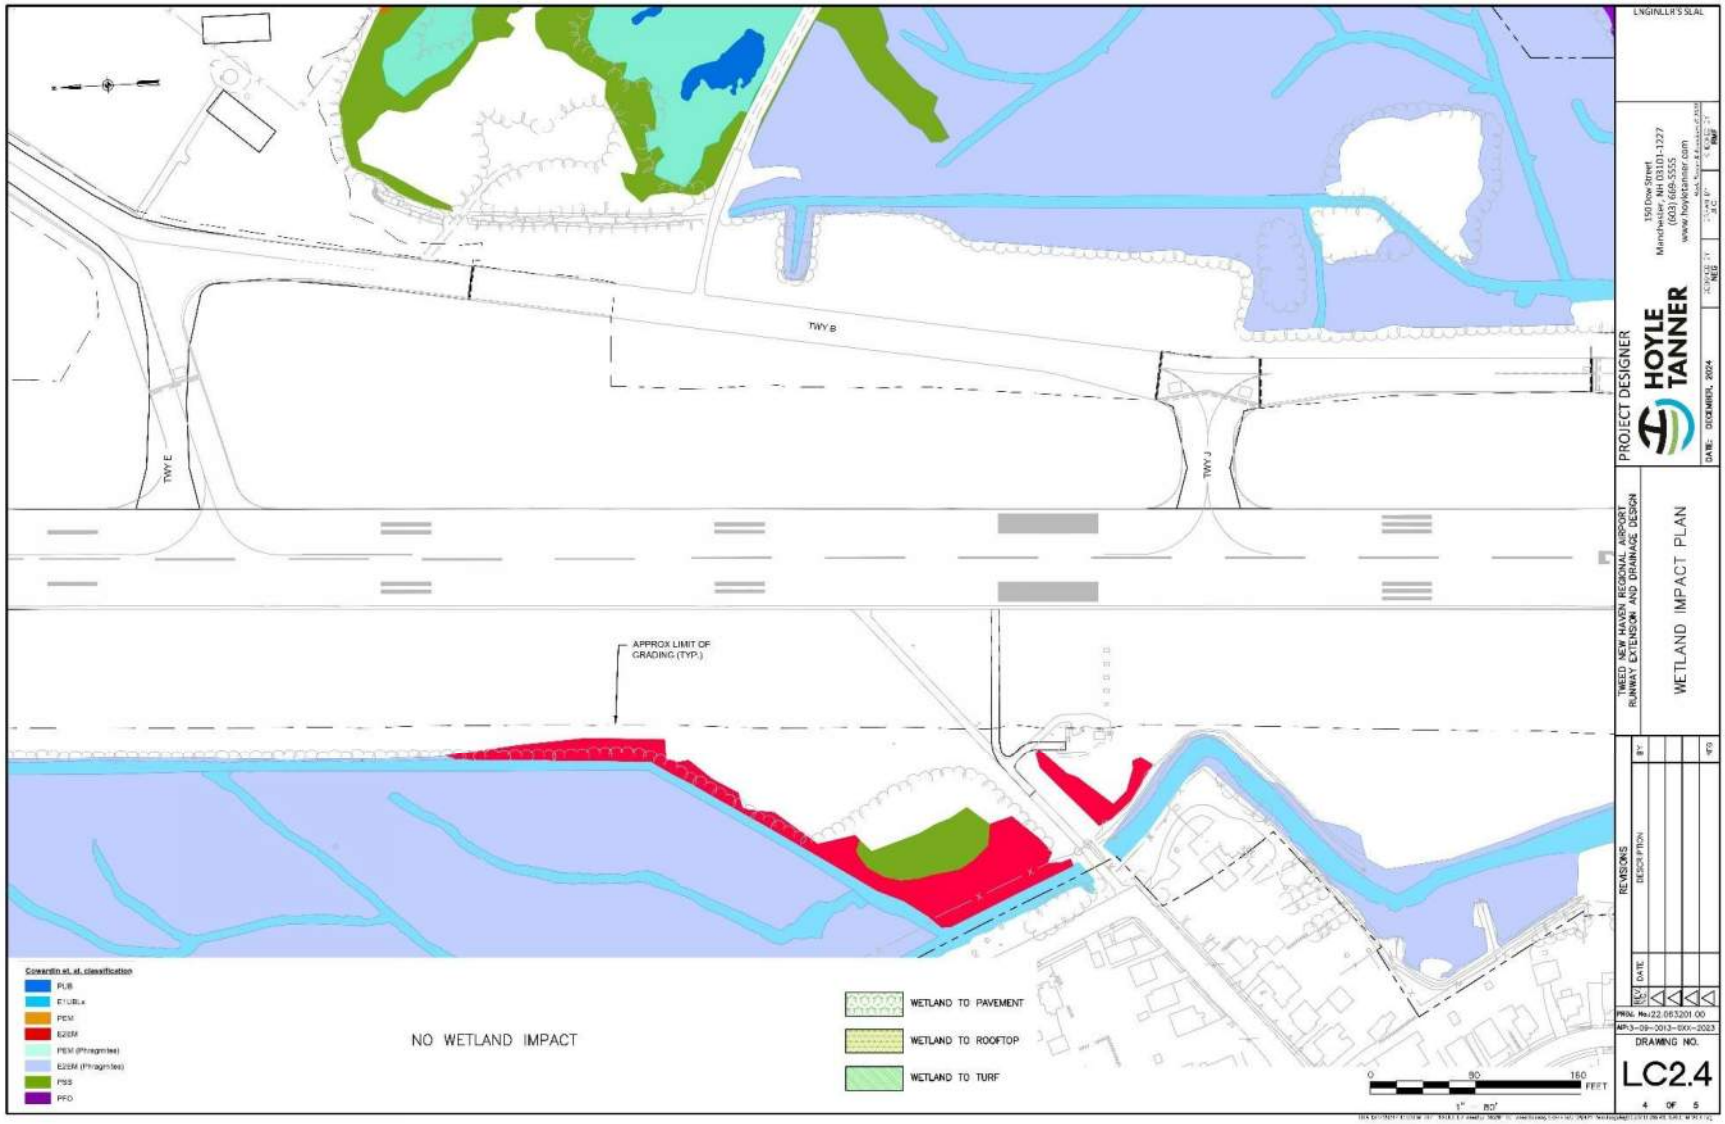

Figure 4 Proposed Project Impacts Plan 4.

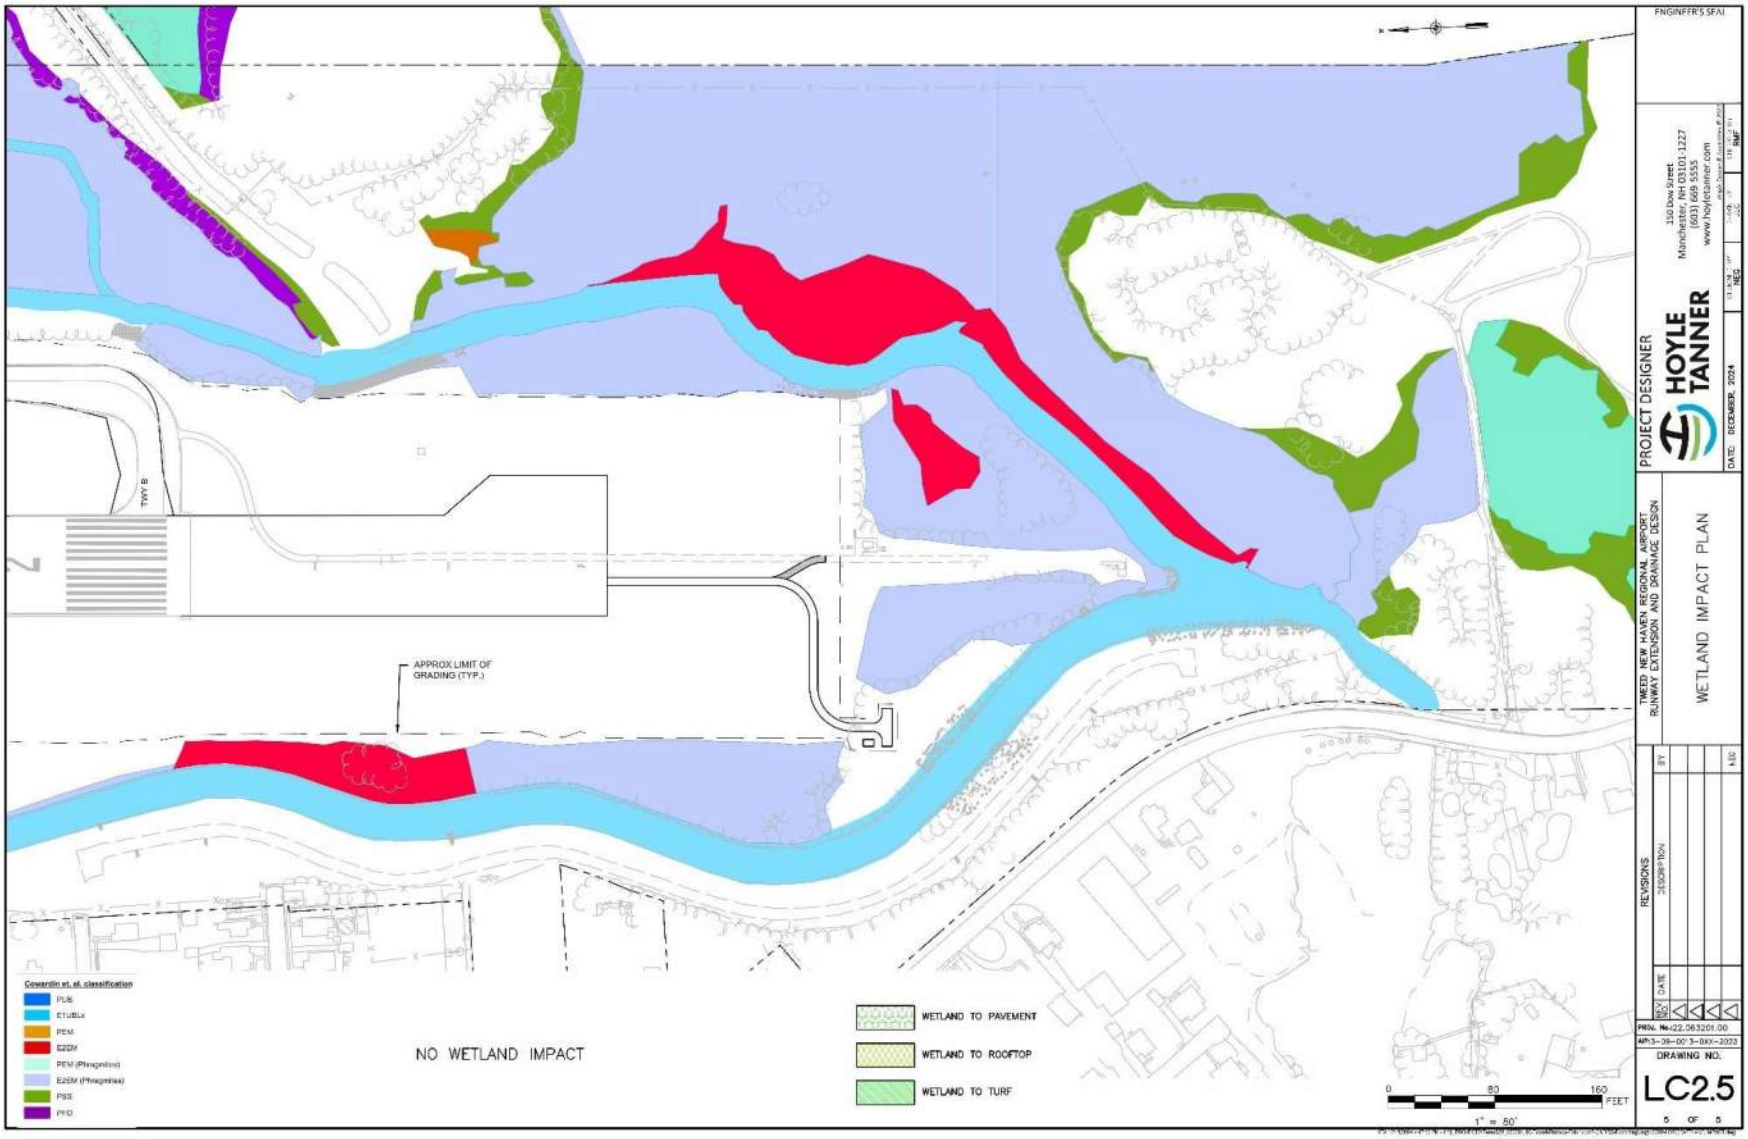

Figure 5 Proposed Project Impacts Plan 5.

The Tweed New Haven Airport Authority proposes improvements to increase the operational efficiency of the airport. These improvements consist of the extension and strengthening of Runway 02-20, drainage improvements, and the replacement of the existing West Terminal with a new terminal ("East Terminal") on previously disturbed land on the east side of the Airport property. Additional elements associated with the East Terminal include associated roadways, parking lots, aprons and taxiways.

The **proposed runway improvements** (extension and drainage) include:

- Extension of Runway 02-20, which entails an approximate addition of 639 feet at the Runway 02 end and 336 feet at the Runway 20 end.
- Adjustment of runway cross-section and profile to be compliant with FAA standards.
- Strengthening of existing runway to meet pavement design requirements of the existing aircraft fleet.
- Incidental grading, stormwater drainage and markings.
- Adjustment of and calibration of navigation aids for both runway ends.
- Installation of runway edge lighting, guidance signs, and other accessory features to be compliant with FAA design standards.

The **proposed East Terminal development** includes:

- New East Terminal Building
  - Construction of a new terminal building ("East Terminal") on the east side of the Airport with an approximate gross square footage (SF) (functional area) of 80,000 SF, with four (4) aircraft gates and two (2) additional aircraft boarding positions (6 total, all ground boarding).
  - Installation/relocation of security fencing and vehicle access gate.
  - Incidental site work, including grading, installation of a stormwater management system and connection to existing on-site utilities such as electricity, water, wastewater, telephone and internet, and site work activities.

- New Apron at East Terminal
  - Construction of a new aircraft apron, with an area of approximately 450,000 SF, including ancillary site elements, would include two (2) Remain Overnight (RON) parking positions and six (6) gate parking positions.
  - Construction of two access taxilanes from the terminal apron to an extended Taxiway A.
  - Incidental site work, including deicing pads, blast deflector fence, grading, stormwater management system and utilities.
  - Removal of a FAA owned decommissioned very high frequency omni-directional range (VOR).

- New Vehicle Parking and Access Road
  - Construction of approximately 2,000 new parking spaces with an approximate footprint of 1,042,000 SF, including building support areas, to serve the new East Terminal.
  - Construction of a causeway and new two-lane (with potential to expand to four lane) airport access road from Proto Drive and associated improvements.

- Installation of electrical lighting, wayfinding, signage, landscaping associated with new parking.
- Incidental site work, including grading, stormwater management system and utilities.

The Proposed Project takes into consideration the Airport's location within the 100-year floodplain and incorporates resiliency measures, such as raising the finished floor elevation above the 100-year flood base flood elevation, placing key building mechanical systems in a raised mezzanine or on roof top locations where they will be above flood elevation, and site design considerations to promote drainage and increase flood resistance for site facilities.

The proposed East Terminal will be constructed on piers, raising the finished floor elevation above mean sea level. The space below the finished floor elevation will be left open to allow floodwater to pass. Additionally, the project will take place within the airport property and within an existing airport-dedicated easement. The new access road will connect with existing Proto Drive; therefore, limited construction would occur within public rights-of-way which mainly entails roads in the immediate vicinity of the Airport. No private property will be acquired as part of the Proposed Project.

1.1 Selection of Proposed Project Site

The location for the Proposed Project at the Airport was selected through a detailed alternatives analysis process outlined in the NEPA Final Environmental Assessment for the Runway 02-20 Extension and Terminal Expansion Program, completed by McFarland Johnson, dated December 2023[1]. The key factors that contributed to the selection of the Proposed Project site (also referred to as the Impact Site) included:

1. **Operational Efficiency**:
    - The Proposed Project allows for the extension of Runway 02-20, which is critical for accommodating larger aircraft and meeting operational requirements for airlines that require a longer runway to reduce weight restrictions and operate more efficiently.
2. **Existing Infrastructure**:
    - The selected project location takes advantage of existing Airport property, minimizing the need for land acquisition or disruption to surrounding residential and commercial areas. It also leverages current Airport infrastructure, including taxiways, aprons, and the air traffic control tower.
3. **Environmental Considerations**:
    - The project site selection process included an effort to avoid and minimize environmental impacts, particularly to wetlands and tidal areas. For example, reducing the runway extension by 60 feet helps avoid construction impacts within intertidal wetlands, which was a significant environmental concern.

[1] Tweed New Haven Airport, National Environmental Policy Act (NEPA) Documents, https://www.tweedmasterplan.com/nepa-documents

4. **Land Use Compatibility**:

    - The Proposed Project site was selected to minimize the disturbance to nearby residential areas and to reduce incompatible land uses around the terminal area. By relocating the terminal building to the east side of the Airport, the Proposed Project avoids disrupting nearby neighborhoods, improves access, and addresses congestion issues.

5. **Flood and Climate Resilience**:

    - The proposed location for the new terminal building is designed with climate resiliency in mind, ensuring that the terminal is raised above the 100-year base flood elevation.

6. **Master Plan Guidance**:

    - The Proposed Project site selection aligns with the Tweed New Haven Master Plan Update dated October 2021, which identified the east side of the Airport as the most suitable location for terminal development and runway extension to address existing congestion and meet future passenger demand.

The Proposed Project site selection was based on a combination of operational, environmental, and logistical factors, aiming to improve the Airport's capacity while minimizing negative impacts on the environment and surrounding communities.

1.2 Project Site Location

The Proposed Project Site is located at the Tweed New Haven Airport (Airport) which is located on the boundary between the City of New Haven and the Town of East Haven, Connecticut. The Airport is situated approximately ¾-mile north of Long Island Sound, ¼-mile east of New Haven Harbor, and ¼-mile from Morris Cove. The Airport is a commercial service airport owned by the City of New Haven and operated by the Tweed New Haven Airport Authority (TNHAA), a quasi-public agency established in 1997. Figure 6 Project Site location map**Error! Reference source not found.** shows the Project Site location.

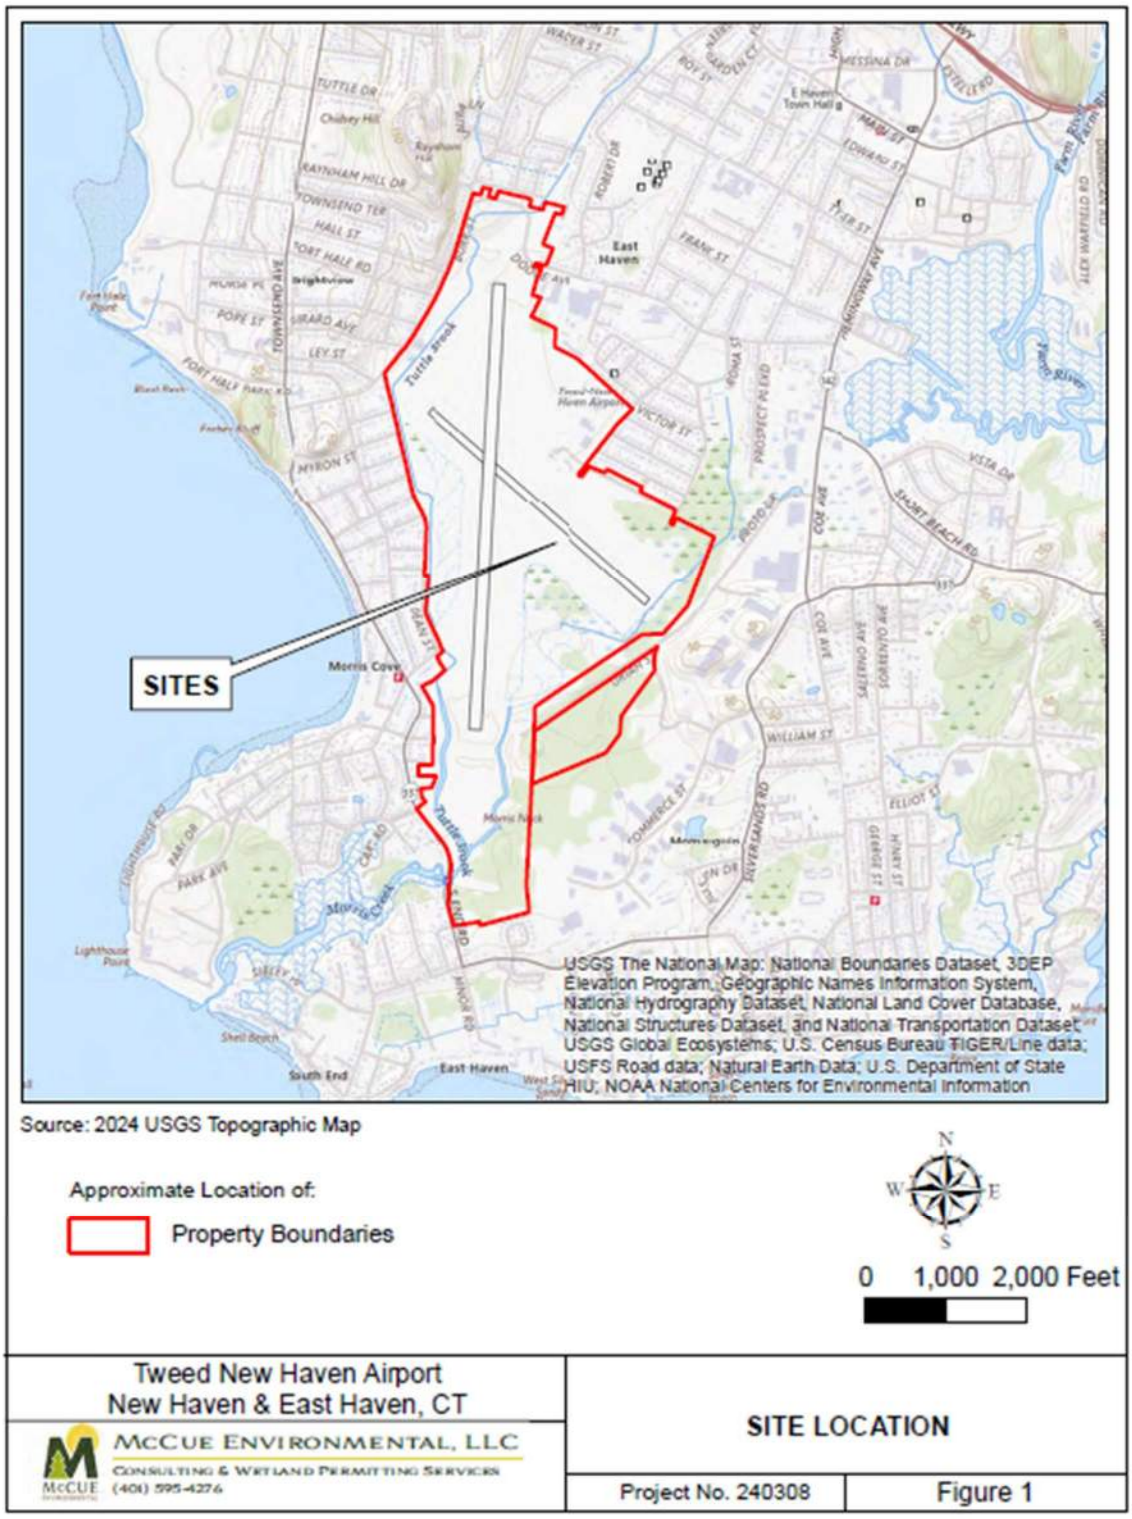

Figure 6 Project Site location map.

1.3 Current Owners

The Airport is owned by the City of New Haven, operated by the Tweed New Haven Airport Authority and managed by Avports.

1.4 Current Land Use and Surrounding Land Use

The land use surrounding and within the Airport property is diverse, reflecting both developed infrastructure and natural areas. Surrounding the Airport, the land use varies between residential, industrial, and undeveloped zones, while the on-site land use is primarily focused on aviation operations, with a mix of built infrastructure and natural wetland environments.

Surrounding Land Use:

- West of the Airport: Primarily residential areas are located between Dean Street and Townsend Avenue.
- East of the Airport: Industrial areas dominate, particularly along Proto Drive and Commerce Street.
- South of the Airport: Undeveloped lands, including wetlands, are found near the southern boundary of Runway 2-20 and the southeast perimeter of the Airport.

On-Site Land Use:

- The airport property consists of runways, taxiways, aprons, parking lots, and access roads.
- Buildings include the terminal, hangars, and facilities for private air carriers, along with maintenance and operations structures, such as a fire and rescue building.
- Mowed and maintained grass fields occupy areas around the runways and taxiways.
- Extensive vegetated tidal wetland systems, including constructed channels and areas of open water, are located along the southwestern, southern, and southeastern perimeter of the airport.

In summary, the Proposed Project Site consists of a mix of aviation infrastructure, industrial and residential areas, and significant wetland systems, reflecting both urban development and natural ecosystems.

1.0 Introduction

This memo outlines eDesign Dynamics' (EDD) modeling efforts to demonstrate the feasibility of tide gate management for wetland mitigation at Tweed New Haven Airport, as detailed in the Draft Wetland Mitigation Plan prepared for Pre-Application Review for submission to CT DEEP.

This modeling study evaluates the effectiveness of modified sluice gate operations in maintaining water surface elevations (WSE) behind the Morris Cove tide gate structure. Specifically, EDD aimed to determine whether adjusted gate operations could sustain an upstream water level of 2.5 ft (NAVD 88) in the marsh's upper reaches for six hours to support the proposed inundation for wetland mitigation.

To assess this, EDD conducted multiple simulations using the HEC-RAS model provided by Hoyle Tanner (HT), analyzing various gate closure scenarios under different tidal conditions. Modeling results suggest that delaying gate closure until the upstream water level reaches 2.59 ft immediately upstream of the tide gate during higher tides effectively maintains a WSE of 2.5 ft for up to six hours in the upper reaches of the marsh, meeting project objectives.

The following analysis examines model predictions across different gate operation scenarios to identify the optimal strategy for WSE control.

2.0 Base Model

A 2D HEC-RAS base model was developed by HT to model the proposed improvement activities at Tweed New Haven airport, titled and submitted as part of the CT DEEP Structures, Dredge, and Fill permit application. The base model was employed to assess floodplain impacts at Tweed New Haven Airport as a result of the proposed project activities. Refer to the full hydraulic report for a detailed description of base model development. A summary description is provided in this section.

For the base model, a pre-project (Natural Conditions) model geometry was developed using a combination of field survey data, bathymetry, and publicly available LiDAR data. The post-project geometry for the base model was developed by modifying the pre-project DEM to reflect proposed project grading.

The hydrologic inputs for the model included peak riverine flows for the 2-, 10-, 25-, 50-, 100-, and 500-year floods. Synthetic 24-hour hydrographs were developed to be used as the upstream boundary conditions in the hydraulic analysis.

The upstream limits of the study area extend approximately 80 ft upstream of FEMA Section C-C (XS 153+80), and the downstream limits extend approximately 1,270 ft downstream of the

existing tide gate, covering approximately 1,100 acres. A 2D computational mesh covering the hydraulic study area was created for both the pre- and post-project comprehensive DEMs, with a default 20-ft x 20-ft cell size. Smaller cells were utilized near existing culverts and in areas with steep, shallow flow. The tide gate was modeled from as-built plans.

3.0 Methodology

EDD used the HEC-RAS base model and data input files shared by HT.

The following geometry file was used for this analysis.

- **Model Geometry File***: PostProjectGeometry_Alt12*

For the downstream boundary conditions and steady upstream inflows, the following boundary condition files were used without modification:

- **Stage/Downstream Boundary Condition***:*
    - *NOAA tide gage data from New Haven, CT (Station ID: 8465705).*

To establish a dynamic tidal stage, data from 24-hour time-period was used (October 29, 2012, 13:30 – October 30, 2012, 13:30), as shown in Figure 1.

- **Flow Data/Upstream Boundary Condition***:*
    - *Tuttle Brook:* steady inflow of 10 cubic feet per second (cfs)
    - *Morris Creek:* steady inflow of 3 cfs

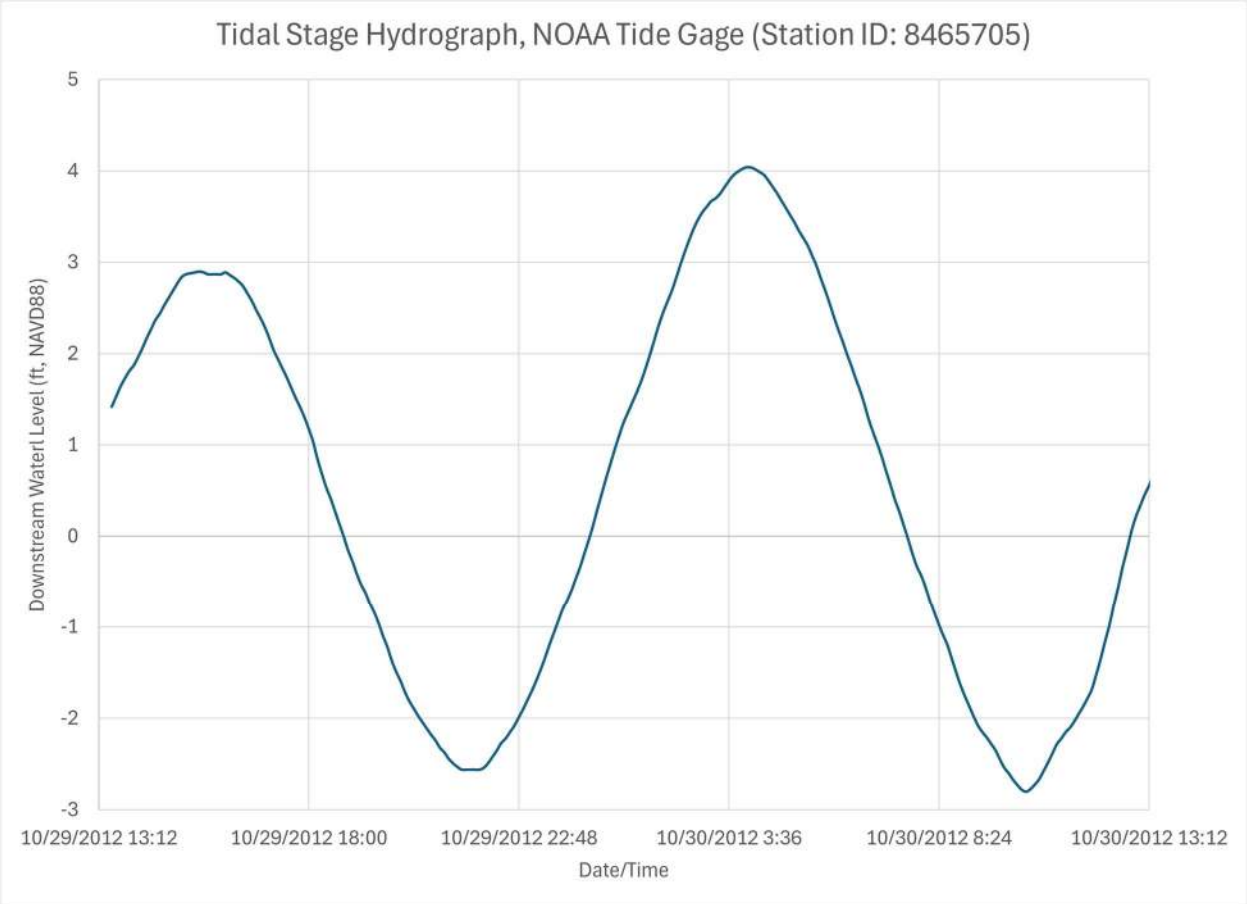

Figure 1. Stage hydrograph of tide at NOAA tide gage, used as downstream boundary condition.

2.1 The Geometry File

EDD modified the geometry file provided by HT to accurately represent the proposed replacement of the existing flap gate with a sluice gate. The key adjustments are as follows:

- **Original Geometry**: The original model from HT represented the three tide gates as separate inline structures, with the two side gates modeled as sluice gates and the middle gate as a flap gate, to represent existing conditions.
- **Modifications**: For this effort, the model was reconfigured to represent the proposed condition by consolidating the three separate structures into a single continuous structure with three openings, each corresponding to an individual tide gate. The middle gate was converted from a flap gate to a sluice gate to allow for adjustable opening height based on operational needs. Additionally, a higher-resolution mesh was applied around the tide gate structure to enhance model accuracy.

2.2 Assessment Locations

The model results were assessed at the following locations, as shown in Figure 2:

- Location 1: Immediately upstream of the tide gate structure.
- Location 2: Northeast side of the runway in the proposed eastern mitigation area.
- Location 3: Northwest side of the runway in the proposed western mitigation area.

Figure 2. Locations where the WSE was analyzed and compared

2.3 Proof of Concept of Tide Gate Operational Procedure

An iterative analysis was conducted to determine the optimal tide gate closure elevation needed to maintain a stable water surface elevation of 2.5 ft in the proposed marsh mitigation areas. The analysis initially calibrated the model by sustaining this elevation for four hours before modeling the proposed duration of six hours. Through multiple simulations, the closure

timing and elevation were refined to optimize upstream water retention while ensuring water levels remained within the acceptable range.

To achieve this, different gate closure elevations were systematically tested to determine the minimum elevation at which the gates should be closed, as measured at Location 1, while assessing their impact on water surface elevations in the marsh areas at Locations 2 and 3. All three gates were operated simultaneously, opening and closing to the same elevation at the same time.

Figure 3 illustrates the various gate closure scenarios that were tested, which include gate closure when the upstream tide level reaches:

A) 2.6 ft
B) 2.59 ft
C) 2.64 ft
D) 2.72 ft

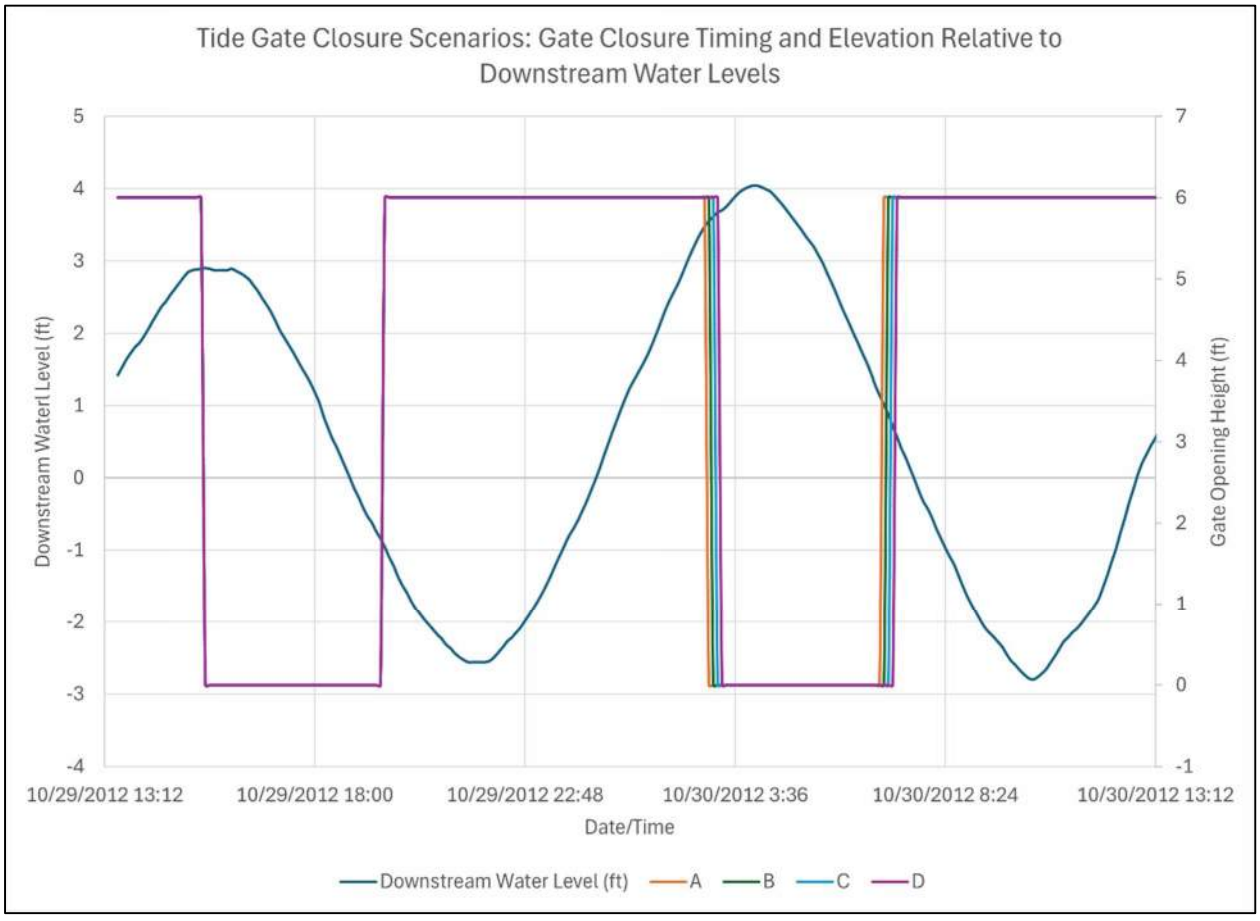

Figure 3. Gate closure scenarios relative to the downstream water level

4.0 Results and Discussion

3.1 Gate Closure Elevation

The results indicated that during the four hour retention closing the sluice gates when the water surface elevation reached 2.59 ft at Location 1 allowed for sustained elevations of 2.5 ft at Locations 2 and 3. Additionally, the analysis demonstrated that the timing of gate closure directly influences the ability to sustain a stable water surface elevation, with variations in closure elevation affecting the duration for which the target level is maintained.

In Scenarios C and D, delayed gate closure, where the gate was closed at a higher elevation, allowed more water to flow upstream before the gate was shut. This additional inflow resulted in water surface elevations exceeding 2.5 ft, as the system received a higher volume of water before the closure took effect. This suggests that closing the gate too late in the tidal cycle can lead to excessive water accumulation, making it more difficult to maintain the target elevation without overshooting.

Conversely, early gate closure represented by Scenario A, where the gate was closed at a lower elevation, restricted the amount of incoming water before the upstream elevation had fully stabilized. While this approach initially limited excessive inflow, it often resulted in an inability to sustain the target water surface elevation for the intended duration. As a result, water levels dropped too quickly and were not maintained at 2.5 ft for the full four -hour period. This indicates that closing the gate too early in the tide cycle can lead to premature declines in water surface elevation, reducing the effectiveness of water retention. Figure 4 illustrates these relationships, providing a visual representation of system performance under different operational scenarios.

Among the gate closure scenarios analyzed, Scenario B, where the gate is closed at an upstream WSE of 2.59 ft at Location 1, yielded the most favorable outcomes. Specifically, Scenario B maintains the WSE within 0.1 ft of the 2.5 ft target for the target duration, the longest consistent duration observed among all scenarios. With other gate closure scenarios, the system fails to meet the target duration as well as the target WSE. Scenario A fails to meet the target inundation duration, while Scenarios C and D result in water surface elevations exceeding 2.5 ft at Location 2. Scenario B's performance aligns closely with the project objective of sustaining a stable WSE during high tide, offering a more consistent and predictable control strategy. This scenario demonstrated an optimal balance by allowing sufficient inflow to raise upstream water levels while preventing overshoot and instability. This scenario's ability to reliably produce the desired hydraulic response at both mid- and upstream marsh zones made it an ideal candidate for extended testing, including the proposed six-hour closure duration analysis.

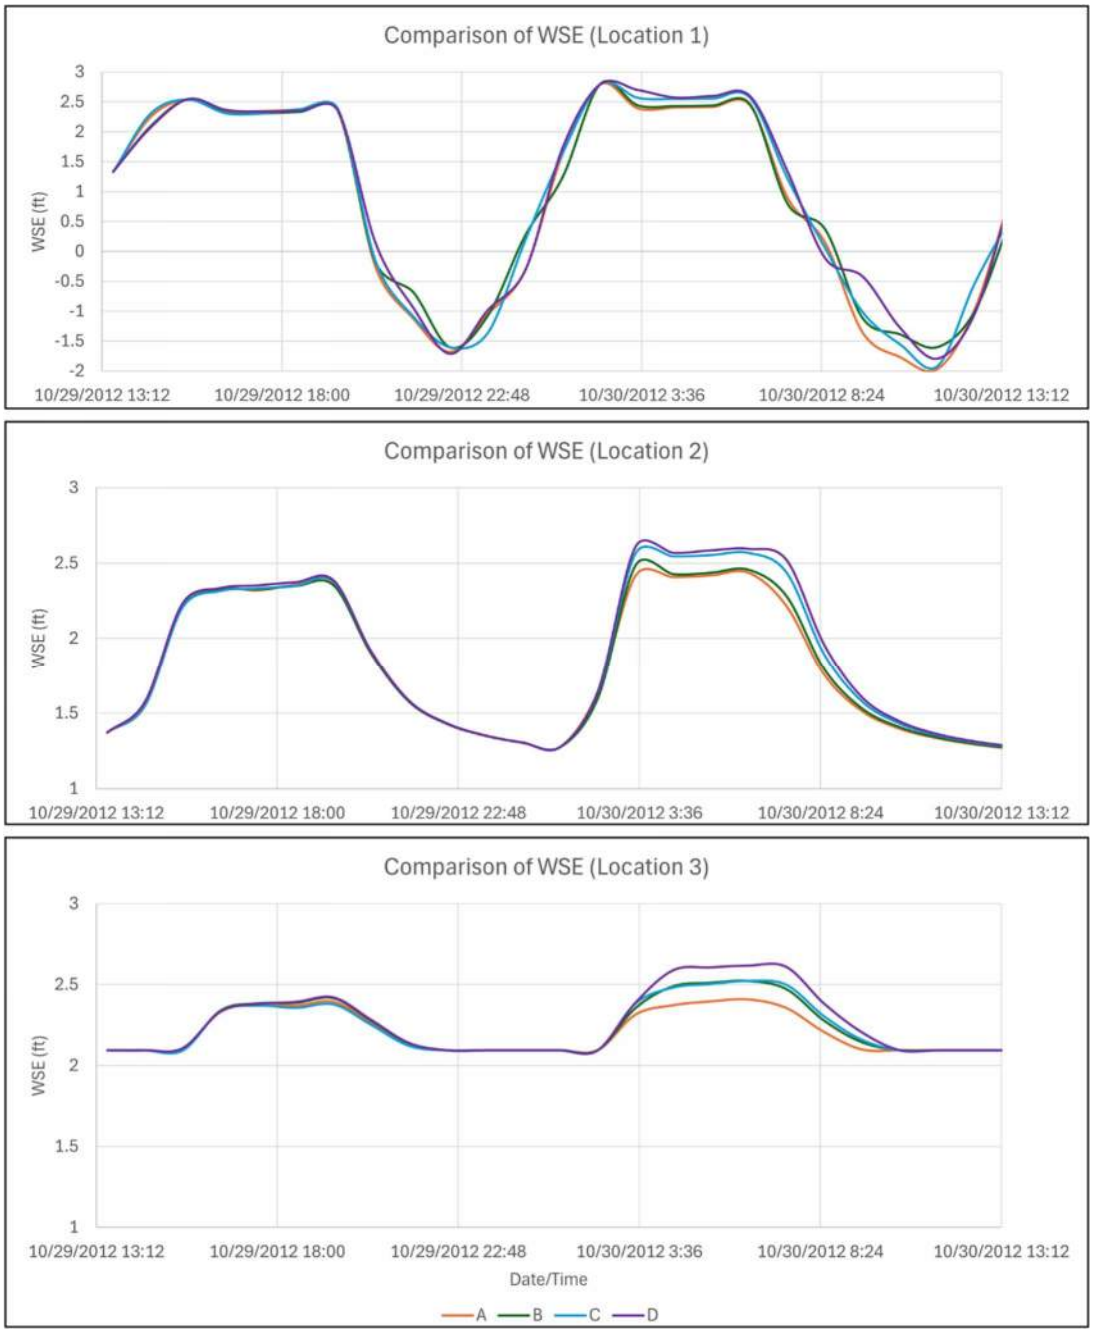

Figure 4. Water surface elevations at Locations 1, 2, and 3 for Scenarios A - D

3.2 Lag Time Analysis

Figure 5 illustrates the observed lag times at the three locations, highlighting the natural delay in water movement through the system. Location 2 experienced a one-hour lag, while Location 3, the furthest upstream, exhibited the longest delay. This pattern confirms that water surface elevation changes take longer to propagate through the marsh system as distance from the tide gate increases.

The lag time at Location 3 was influenced by the water surface elevation at the time of gate closure. When water levels were lower, stabilization occurred approximately one hour after Location 1. At slightly higher water levels, the lag extended to just over an hour, and at even higher elevations, it increased to nearly two hours.

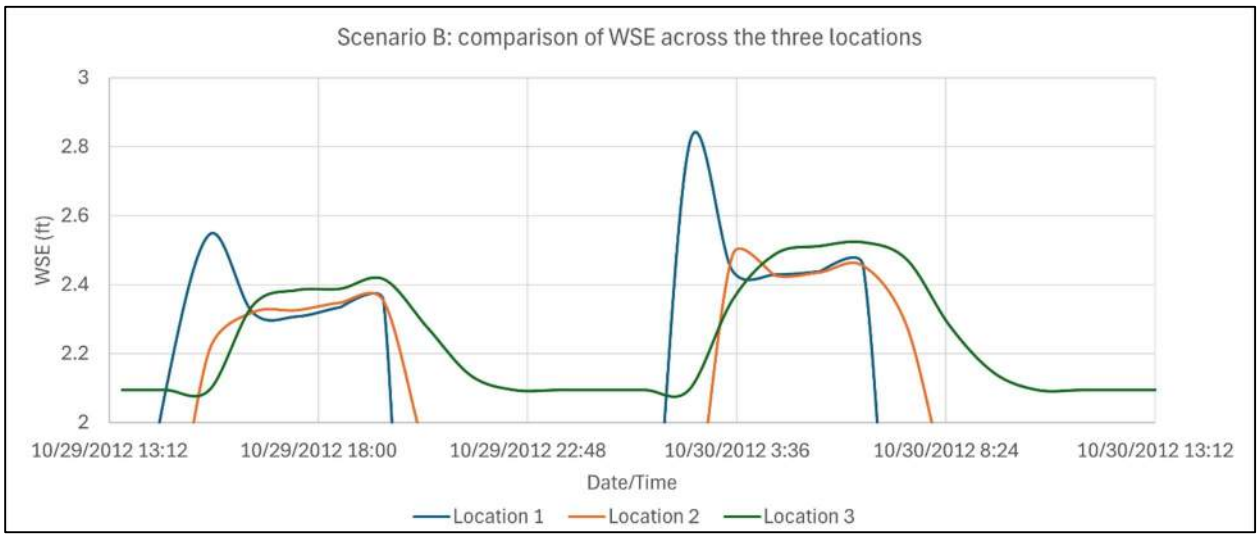

Figure 5. Lag time between the three locations (Scenario B)

These findings indicate that as more water moves through the system, upstream locations require additional time to stabilize. These findings confirm that the water surface elevation associated with gate closure directly affects lag time, with closures at higher water surface elevations resulting in longer delays in upstream water level stabilization.

3.3 Gate Closure Duration

To assess the impact of extended gate closures, the following section examines a six-hour closure period—selected based on the target inundation duration—compared to the initial four-hour period used during model calibration.

For the six-hour trial run, the tide gates were closed at the optimal upstream water surface elevation of 2.59 ft. The WSE response was monitored at the three key locations to assess the impact of the extended closure period.

The results indicate that water surface elevations at all locations were more stable during the six-hour closure duration compared to the four-hour duration. As expected, Location 1 closest to the tide gate exhibited the most immediate response, with WSE fluctuations aligning with the tidal cycle. In contrast, Locations 2 and 3, further upstream, experienced a more gradual response, with delayed and dampened fluctuations due to the natural lag in water movement.

Extending the closure period from four to six hours resulted in more sustained higher water surface elevations at upstream locations. In the four-hour trial, water surface elevation at Location 3 occasionally failed to reach the target elevation, particularly during the first tidal

cycle of the 24-hour duration, which experienced a lower-than-normal tidal peak. However, in the six-hour trial, water surface elevation at Location 3 more consistently approached or maintained 2.5 ft for an extended duration. While lag times for upstream stabilization persisted, the extended closure period reduced rapid fluctuations, leading to a more controlled and predictable water level pattern.

Overall, the six-hour closure improved water retention and stability at upstream locations, demonstrating that increasing closure duration can enhance control over water surface

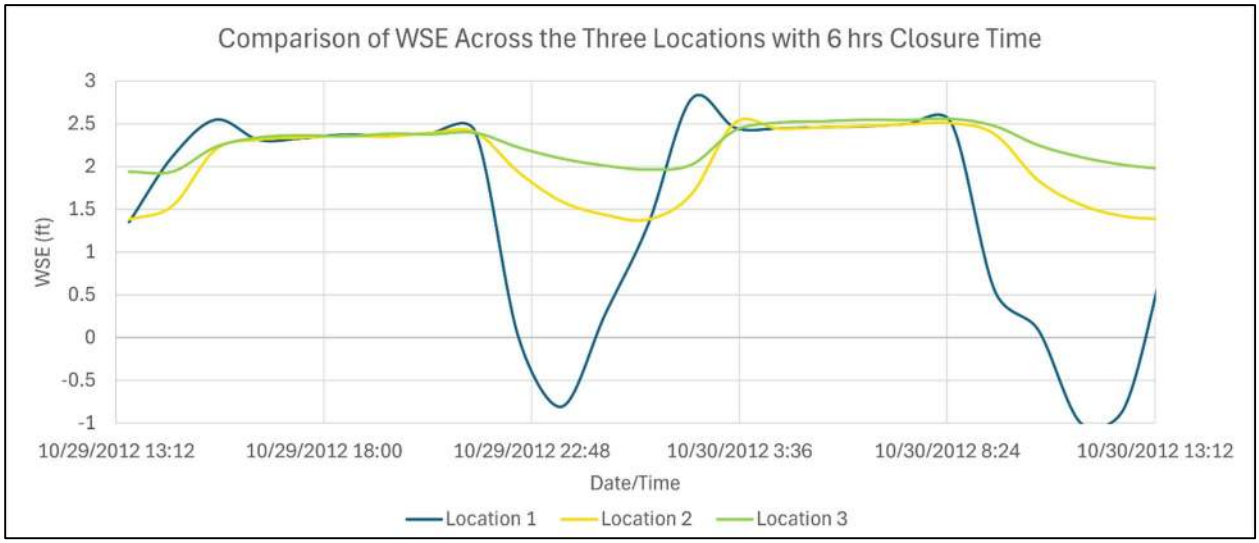

Figure 6. Water surface elevation with 6 hrs gate closure at Locations 1, 2, 3

elevation and reduce fluctuations. However, as observed in previous analyses, longer closure durations also resulted in extended lag times at Locations 2 and 3, reinforcing the need to balance closure timing with upstream response dynamics. These results are shown in Figure 6.

5.0 Conclusion

The hydraulic analysis of proposed tide gate operations confirms that modified sluice gate operations can effectively maintain target water surface elevations of 2.5 ft for extended durations in the target marsh areas. Through an iterative modeling approach, a gate closure triggered at an upstream water surface elevation of 2.59 ft proved most effective, consistently maintaining the target elevation during both four-hour and six-hour closure durations.

The results demonstrate that increasing the closure duration from four to six hours improved water retention and stability at upstream locations. The six-hour closure period led to more consistent water surface elevations at Locations 2 and 3, particularly at Location 3, which previously exhibited difficulty reaching the target elevation in the four-hour trials. While longer closure durations helped minimize fluctuations and provided greater control over water levels, they also resulted in extended lag times between gate closure and upstream water level stabilization, particularly at more distant locations.

Balancing closure timing with upstream response is key to optimizing water retention while minimizing delays. Refining tide gate operations will enhance marsh inundation, support ecological function, and ensure long-term stability.

ATTACHMENT 18 – ENGINEERING REPORT COVER SHEET

Connecticut Department of
Energy & Environmental Protection
Bureau of Water Protection & Land Reuse
Land & Water Resources Division

LWRD License Application
Engineering Report Cover Sheet

This Cover Sheet is a checklist of requirements that need to be completed and submitted with the engineering report. Please complete this checklist by identifying where each requirement listed is addressed in the engineering report (report title and page numbers). If an item is not applicable, place "NA" in the box. The engineer report must fully describe the design of the proposed facilities or other actions and the hydraulic and hydrologic effects thereof. This Cover Sheet is required to be signed and sealed by a professional engineer licensed in the State of Connecticut.

Stormwater Management

Engineering Report section title and page number	Requirement Description
Stormwater Management Report, Section 2	Description of the design storm frequency intensity, volume and duration
Stormwater Management Report, Appendix A	Watershed maps, existing and proposed
Stormwater Management Report, Appendix B, Appendix G	Computations for Tc
Stormwater Management Report, Appendix B	Imperviousness calculations
Stormwater Management Report, Appendix B	NRCS runoff curve numbers, volumetric runoff coefficients
Stormwater Management Report, Appendix B	Computations used to determine peak runoff rates, and velocities for each watershed area (24-hour storm): • Stream Channel Protection: 1-year, 2-year frequency (“over-control” of 2-year storm) • Conveyance Protection: 10-year frequency • Peak Runoff Attenuation: 2-year, 10-year, 25 year, and 100-year frequency • Emergency Outlet Sizing: safely pass the 100-year frequency or larger storm
Stormwater Management Report, Appendix B	Hydrograph routing calculations
Attachment 14, Project Plans	Description, schematics, and calculations for drainage and stormwater management systems
Attachment 14, Project Plans	Infiltration rates, geotechnical information, test pit data, perc test data, conductivity testing data
Stormwater Management Report, Appendix H	Documentation of sources
Available on Request	Electronic files in native format for any computer modelling generated for analysis.

Stormwater Management

Engineering Report section title and page number	Requirement Description
N/A	Detention basin analysis including timing and duration of expected outflow, stream stability analysis and hydrograph summation
Stormwater Management Report, Appendix E, Appendix F	Erosion & sedimentation calculations for any engineered measures
Stormwater Management Report, Appendix C, Appendix D	Calculations for any engineered water quality treatment measures

Floodway/Floodplain Assessment

Engineering Report section title and page number	Requirement Description
Floodway/Floodplain Assessment Report Sections 2, 3, 5, 7, 10	Description of existing and proposed conditions upstream and downstream of the proposed activity
Floodway/Floodplain Assessment Report Appendix I	For any bridge or culvert placement or replacement with a drainage area of 100 acres or more, plan sheets showing the existing and proposed inundation area for the 2, 10, 25, 50, and 100 year discharges, carried to convergence
Stormwater Management Report, Section 6	Flood Contingency Plan
N/A	A description and analysis of the floodplain modifications required to restore any flood conveyance and flood storage capacity
Floodway/Floodplain Assessment Report Section 6, 7, 8	Demonstration that backwater from the proposed activity will not impact an existing dam, dike, detention, or similar structure
Floodway/Floodplain Assessment Report Appendix C, D, E, F, G, H, I, J, K	Backup data and complete hydraulic analysis for proposed modifications to the floodplain including location plan and plot for sections, profile sheet, summary sheet (for riverine modeling, refer to: https://www.fema.gov/sites/default/files/2020-02/Hydraulics_OneDimensionalAnalyses_Nov_2016.pdf)
Attachment 14, Project Plans	Description, schematics, and calculations for bridges and culverts

Structures within a Coastal Floodplain

Engineering Report section title and page number	Requirement Description
N/A	Longshore sediment transport impact report
N/A	Wind, wave, load analysis for significant public access structures (Only for Flood Management Certification)
N/A	Wind, wave, load analysis for flood and erosion control structures (e.g. seawalls, bulkheads, revetments, berms, jetties, etc.)
Wetland Mitigation Plan, Sections 2 & 3	Hydrologic / Hydraulic impact report for tide regulating / influencing structures (e.g. culverts, tidegates, flood berms / levees, etc.)

Professional Certification

For any engineering report submitted as part of the LWRD License application, the following certification must be signed and sealed by a professional engineer licensed to practice in Connecticut and submitted with the Engineering Report Cover Sheet.

"I certify that in my professional judgement, each requirement listed in the Engineering Report Cover Sheet has been addressed in the engineering report submitted as part of the LWRD permit application and that the information is true, accurate and complete to the best of my knowledge and belief.

This certification is based on my review of the engineering report.

I understand that a false statement made in the submitted information may, pursuant to Section 22a-6 of the General Statutes, be punishable as a criminal offense under Section 53a-157b of the General Statutes, and may also be punishable under Section 22a-438 of the General Statutes."

Appendix H Documentation of Sources

1. PROJECT DESCRIPTION

The Tweed New Haven Airport Authority (TNHAA) and The New HVN LLC proposes the extension of Runway 02-20, drainage improvements and the replacement of the existing West Terminal with a new terminal ("East Terminal") on previously disturbed land on the east side of the Airport property. Additional elements associated with the East Terminal include associated roadways, parking lots, aprons and taxiways.

The proposed runway improvements (extension and drainage) include:

- Extension of Runway 02-20, which entails approximately an additional 639 feet at Runway 02 end and 336 feet at Runway 20 end.
- Adjusting runway cross-section and profile to be compliant with FAA standards.
- Strengthen existing the runway to meet pavement design requirements of the existing aircraft fleet.
- Incidental grading, stormwater drainage and markings.
- Adjusting and calibrating navigation aids for both runway ends.
- Installing runway edge lighting, guidance signs, and other accessory features to fully comply with FAA design standards.

The proposed East Terminal development includes:

- New East Terminal Building
    - Construction of a new terminal building ("East Terminal") on the east side of the Airport with an approximate gross square footage (SF) (functional area) of 80,000 SF, with four gates and two additional boarding positions (6 total, all ground boarding).
    - Installation/relocation of security fencing and access gate.
    - Incidental site work, including grading, stormwater management system and connection to existing on-site utilities such as electricity, water, wastewater, telephone and internet, and site work activities.

- New Apron at East Terminal
    - Construction of a new aircraft apron, with an area of approximately 450,000 SF, including ancillary site elements, would include two Remain Overnight (RON) parking positions and six gate parking positions.
    - Construction of two access taxilanes from the terminal apron to an extended Taxiway A.
    - Incidental site work, including deicing pads, blast deflector fence, grading, stormwater management system and utilities.
    - Removal of a FAA owned decommissioned very high frequency omni-directional range (VOR).

- New Vehicle Parking and Access Road
    - Construction of approximately 2,000 new parking spaces with an approximate footprint of 1,042,000 SF, including building support areas, to serve the new East Terminal.
    - Construction of a causeway and new two-lane, with potential to expand to four lane, airport access road from Proto Drive and associated improvements.
    - Installation of electrical lighting, wayfinding, signage, landscaping associated with new parking.
    - Incidental site work, including grading, stormwater management system and utilities.

Wetland Mitigation that will be included as part of the overall project to address wetland impacts will include enhancement of 28.5 acres of tidal salt marsh complex within existing Phragmites-dominated marsh areas by increasing the depth and duration of inundation of tidal water within these marshes. The enhancement objectives will be primarily achieved by modifying the operational procedure of the existing tide gate. The storm event / wet weather operations procedure of the tide gate will remain unchanged, ensuring flood prevention through the use of the Watershed Drain Mode when severe weather is forecast. Mitigation will also include the creation of 3.61 acres of tidal salt marsh complex within upland areas of the Airport property dominated by Phragmites australis. This process will involve excavating existing upland material, ensuring tidal flow through the creation of tidal channels that connect with existing channels, placing a clean, sandy planting medium, and grading the site to appropriate elevations for tidal inundation—the upper quarter of the tidal cycle. The newly created marsh will be planted with native salt marsh vegetation, including Spartina alterniflora in low marsh zones, to support habitat function and ecological resilience.

The project takes into consideration the Airport's location within the 100-year floodplain and would incorporate resiliency measures, such as raising the finished floor elevation above the 100-year flood elevation, placing key building mechanical systems in a raised mezzanine or roof top location where they would be above flood elevation, and site design considerations to promote drainage and make facilities flood resistant. The proposed East Terminal would be constructed on piers, raising the finished floor elevation above mean sea level. The space below the finished floor elevation would be left open to allow floodwater to pass. Additionally, the project would take place within the airport property and within an existing airport dedicated easement. The new access road would connect with existing Proto Drive; therefore, limited construction would occur within public rights-of-way which mainly entails roads in the immediate vicinity of the Airport. No private property is intended to be acquired as part of the project

2. STUDY METHODOLOGY AND ASSUMPTIONS

HydroCAD Stormwater Modeling System Software (Version 10.20-5c) was used to model the 2, 10, and 100-year storm events for a Type III 24-hour storm. Precipitation amounts from NRCS Design Storm specifications for New Haven County, Connecticut were utilized.

Table 1 – Rainfall Amounts

Storm Durations	2-Year	10-Year	100-Year
24 Hour	3.35"	5.23"	8.23"

The TR-55 method was used to estimate the Time of Concentration (Tc). This method involves estimating the length of sheet flow, shallow concentrated flow and channel flow that occurs within each subcatchment. Each Tc Path and corresponding length and slope is identified in the Existing and Proposed Watershed Plans (Appendix A). From this information, the time of concentration is determined for each watershed. If the calculated time of concentration was less than 5 minutes for a subcatchment, the Direct Entry method was used with a minimum time of concentration of 5 minutes.

CN values were determined using surface descriptions listed in HydroCAD's CN data table and the average soil condition for the area as determined from the USGS Web Soil Survey boundaries. The original and proposed cover types were assumed to be either Impervious (Paved Parking lots, roofs, driveways, etc.) or non-grazed meadow. Both are under the Fully Developed Urban Areas category. Both freshwater and saltwater wetlands are approximated using the Water Surface 0% impervious curve number. Roofs and miscellaneous impervious cover types were lumped in with unconnected impervious due to the scale of the project area.

The following reports regarding the project site's soils, natural resources, and subsurface investigation are included as attachments to the permit application:

- Subsurface Site Investigation by BL Companies (January 2025)
- Geotechnical Investigation by RW Gillespie (March 2024)

3. EXISTING CONDITIONS

Under the existing conditions, the site is modeled as forty-one subcatchment areas that are bound by grade breaks and topography. This includes Runway 02-20, Airport Access roads to the north, proposed access road to the south, as well as natural grade breaks in the wetland area to the west and east side of the runway. The model has 4 analysis points located around the site that direct stormwater to the final terminus analysis point AP1 located near the tide gate.

West of the runway, there are seven subcatchment areas that flow to 1L. Analysis point 1L is located on the northwest parking lot where stormwater runoff enters the Tuttle Brook flowing south to the tide gate. Continuing south, there are six subcatchment areas that flow to 2L. Analysis point 2L is located in Tuttle Brook south of 1L. Stormwater runoff continues flowing south towards the tide gate from analysis point 2L.

East of the runway, there are fifteen subcatchment areas that flow to 3L. Analysis point 3L is located in the eastern wetlands north of Pig Farm Road. Continuing south, there are seven subcatchment areas that flow to 4L. Analysis point 4L is located in Morris Creek south of 3L. Stormwater runoff continues flowing south towards the tide gate from analysis point 4L.

At the south end of the runway, there are six subcatchment areas that flow to AP1. Analysis point AP1 is located near the tide gate where Tuttle Brook meets Morris Creek. AP1 represents the only outfall from the site.

The following table summarizes the existing flows during the 2, 10, and 100 – year storm events:

Table 2 – Existing Flows

Analysis Point	Discharges by Storm Event (cfs)		
	2-yr	10-yr	100-yr
1L	56.16	124.67	249.29
2L	151.66	317.02	604.73
3L	104.86	225.13	424.71
4L	200.97	388.79	707.81
AP1 (FINAL)	**374.05**	**767.51**	**1449.80**

4. PROPOSED CONDITIONS

Under the proposed conditions, the site is modeled as fifty-eight subcatchment areas that are bound by similar grade breaks as the existing conditions with the addition of new closed drainage systems and water quality treatment. The proposed model has the same 4 analysis points that direct stormwater to the final terminus analysis point AP1 located near the tide gate.

West of the runway, there are eight subcatchment areas that flow to analysis point 1L. Continuing south, there are six subcatchment areas that flow to analysis point 2L. Runway subcatchment area S19A is treated by a sand filter (node T1) before discharging into Tuttle brook.

East of the runway, there are eight subcatchment areas that flow to analysis point 3L. East Terminal subcatchment areas 1, 2, 3, 4, 5, 6, and 7 are collected and treated by sub-surficial sand filters and hydrodynamic separators prior to being discharged by the northwest pump station (node PS1). Flow from the northwest pump station and subcatchment S9 are directed to a series of proposed box culverts (node 11P) that run under the proposed causeway. Continuing south, there are thirty subcatchment areas that flow to analysis point 4L. Runway subcatchment areas 7A, 3A and 3B are treated by sand filters (nodes T2, T3, T4) before discharging into Morris Creek. East Terminal subcatchment areas A1, A2, A3, 8, 9A, 9B, 9C, 9D, and 9E are collected and treated by sub-surficial sand filters and hydrodynamic separators prior to being discharged by the southeast pump station (node PS2). In addition, Runway subcatchment areas N3, N4, N6, N7, N8, N9, N10, N12, N14, N15, DS1, DS2, and DS3 are directed to a series of proposed arch culverts (node CC1) that bypass analysis point 3L and discharge into Morris Creek.

At the south end of the runway, there are six subcatchment areas that flow to AP1. Analysis point AP1 is located near the tide gate where Tuttle Brook meets Morris Creek. AP1 represents the only outfall from the site.

The following table summarizes the proposed flows during the 2, 10, and 100 – year storm events:

Table 3 – Proposed Flows

Analysis Point	Discharges by Storm Event (cfs)		
	2-yr	10-yr	100-yr
1L	47.82	111.42	231.56
2L	124.12	265.06	516.39
3L	97.06	203.85	386.31
4L	248.57	450.97	739.04
AP1 (FINAL)	**400.27**	**793.57**	**1446.46**

The following table compares the proposed flows to the existing flows for the 2, 10, and 100 – year storm events:

Table 4 – Proposed vs. Existing Flows

Analysis Point	Discharges by Storm Event (cfs)		
	2-yr	10-yr	100-yr
1L	-8.34	-13.25	-17.73
2L	-27.54	-51.96	-88.34
3L	-7.8	-21.28	-38.40
4L	+47.60	+62.18	+31.23
AP1 (FINAL)	**+26.22**	**+26.06**	**-3.34**

Per Chapter 4 page 58 of the Connecticut Stormwater Quality Manual, the review authority may waive compliance with one or more of the peak runoff attenuation requirements for sites that discharge into tidal waters. The Runway Extension and Terminal Expansion project will have minimal to no impact on the Tuttle Brook-Morris Creek floodplain for lower storm events and no impact on the regulatory 100-year floodplain. Refer to the "Floodway/Floodplain Assessment Report" in this application for more information.

5. WATER QUALITY TREATMENT MEASURES

The proposed Runway water quality measures include:

Impervious Area Disconnection

Per Chapter 5 of the Connecticut Stormwater Quality Manual – Impervious area (simple) disconnection can be used to direct runoff from roofs, driveways, roads, parking lots, and solar arrays to natural or landscaped vegetated areas that are of sufficient size and with adequately permeable soils (also called "Qualifying Pervious Areas" or QPAs) to disperse and retained runoff without causing erosion, basement seepage, or negative impacts to adjacent downgradient properties.

If stormwater runoff from an impervious area is directed to a QPA that meets the minimum criteria described in Chapter 5, the area can be deducted from the total impervious area, reducing the required Water Quality Volume and Required Retention Volume of the site and the size of the structural stormwater BMPs needed to meet the retention and treatment requirements of Standard 1.

See the Treatment Plan in Appendix C of this report for the areas labeled as Qualifying Pervious Area. These areas meet all criteria described in Chapter 5 of the Connecticut Stormwater Quality Manual. They are located outside of wetlands, consist of low-maintenance grasses, have a minimum of 4" topsoil, sloped less than 8%, flow enters and remains as sheet flow, and have a depth to seasonal high groundwater of 18 inches or greater. The lengths and widths of the QPA's shown in the Treatment Plan are equal to or exceed the lengths and widths of the contributing impervious areas.

HSG classification and depth to seasonal high groundwater table for these areas were verified by a Qualifying Professional through field evaluation performed by BL companies.

Surface Sand Filter with Underdrain and Liner

Sand filters were designed to treat the remaining portions of the site where the impervious area could not be disconnected. The reason these areas could not be disconnected is due to the separation to seasonal high groundwater table was less than 18" as shown in the field evaluations performed by BL Companies and R. W. Gillespie.

The Treatment Plan in Appendix C of this report identifies four directly connected impervious areas (DCIA 1, DCIA 2, DCIA 3, DCIA 4). Runoff from these four areas are pretreated by vegetative filter strips before entering a surface sand filter. These sand filters will include an underdrain system and impermeable liner due to the required vertical separation to seasonal high groundwater table described in Chapter 8 of the Connecticut Stormwater Quality Manual could not be met. Buoyancy calculations were performed due to the seasonal high groundwater being located above the bottom of our systems, see Appendix C in this report for calculations.

These lined sand filter systems are suitable for providing treatment but do not provide retention credit. To demonstrate compliance with Standard 1 of the Connecticut Stormwater Quality Manual, individual pollutant calculations were performed to show the sand filters exceed the minimum pollutant reductions shown in Table 4.3 of the Connecticut Stormwater Quality Manual.

As shown in Appendix C of this report, the pollutant reduction of each sand filter exceeds the requirements of Table 4.3. The sand filters are sized to convey the 10-year 24-hour storm event through an outlet pipe and an emergency spillway to convey the 100-year storm. The sand filters will be constructed and maintained per all criteria described in Chapter 13 of the Connecticut Stormwater Quality Manual. See Attachment 14 – Project Plans for further sand filter details.

The proposed East Terminal water quality measures:

Due to the proximity to air operations and the need to minimize open bodies of water, water quality requirements will be satisfied through a series of sub-surficial sand filters or hydrodynamic separators. For the purposes of this design the sand filters were based on StormTrap units. A total of 9 filters are distributed throughout the site. In some locations, hydrodynamic separators will treat stormwater, using Stormtrap's SiteSaver as the basis of design. These were chosen for use where the sand filter's size or depth could cause issue. A total of 8 hydrodynamic separators are distributed throughout the site. Filters and hydrodynamic separators are located prior to discharge to the pump stations and are sized to treat the required Water Quality Volume.

Water Quality Volume (WQV) requirements will be met through the use of underground filter units. The WQV calculations were performed in accordance with the State of Connecticut Department of Energy and Environmental Protection standards. The required WQV was calculated for the individual sub-basins contributing to each filter unit.

See Appendix D for East Terminal Water Quality Treatment calculations.

6. FLOOD CONTINGENCY PLAN

The majority of Tweed New Haven Regional Airport is subject to flooding during a 100-year storm event and is therefore located within a coastal hazard area. Based on the recently revised Flood Insurance Rate Maps (FIRMs) for the City of New Haven and the Town of East Haven (New Haven County CT, Panel 444 of 635, Revised to Reflect LOMR effective January 10th, 2025), flood prone areas onsite include unnumbered areas within AE zones. The 100-year flood elevation is delineated at 12 feet NAVD. With the exception of some land north of Dodge Avenue and several isolated knolls in wetlands, all airport property is at or below 12 feet NAVD.

In both pre- and post-construction periods, the Tweed-New Haven Airport Authority relies upon advanced warning by the National Weather Service of an approaching severe storm on the magnitude of a 100-year event. In such instances, all removable equipment, i.e., bulldozers, dump trucks, miscellaneous motors and generators, etc., will be removed from the construction site to locations above the 100-year flood elevation. Similarly, stockpiles of supplies, i.e., framing lumber, floatable construction materials, and so on, will be moved to sites or locations above the 100-year flood elevation and/or off the property to higher ground. Additionally, the City of New Haven and the Airport have the ability to manipulate the flood control tide gates downstream of this site. In anticipation of a storm event, the tide gates are opened and closed accordingly to allow the site to be drained and provide flood storage. Although this control is limited due to the size of the flood plain and the limitations of the hydraulic openings of the floodgates, this is effective in high frequency storm events and will provide protection to the project site during construction.

Adherence to these measures is indicated clearly on the construction plans and the contractor is required to meet all CTDEEP flood contingency requirements during construction. Hazardous materials such as small construction equipment with diesel tanks, portable generators, de-watering pumps, construction light carts, etc. will be removed from the site in anticipation of a 100-year storm. Per CTDEEP requirements, the same list of typical items would be removed from the site in anticipation of a 500-year storm.

According to the existing FEMA floodplain maps, there are two reasonably accessible areas on airport property that would stay dry in a 500-year storm. One location is approximately 1 acre in size and the other is approximately 3 acres in size. To put these areas in perspective, the airport is approximately 395 acres; the total accessible high ground in a 500-year storm (approximately 4 acres) represents 1 percent of the total airport property area. Although this is a small area to plan on for contingency, the airport will make both areas available to the contractor for equipment storage in event of a 100-year or 500-year storm.

The Runway Extension and Terminal Expansion project at Tweed New Haven Regional Airport has no net effect on the site's hydraulic drainage characteristics during rain events. Refer to the "Floodway/Floodplain Assessment Report" for more information.

WATER QUALITY VOLUME CALCULATIONS (AREA 1)

Date: December 10, 2024
Project: HVN
Project No:
Location: New Haven, CT

Prepared By: Date: 1/6/2025
Checked By: Date:

Objective: To determine the required Water Quality Volume (WQ_V) for adequate stormwater treatment

Methodology: Calculations are in accordance with methods described in the Connecticut Stormwater Quality Manual (March 2024) Appendix D - Water Quality Flow Calculation Method. Per Table 4-1 Stormwater Management Standards and Performance Criteria Summary, Required Retention Volume (RRV) is 100% of the site's Water Quality Volume (WQV) for all new development, redevelopment or retrofit of sites that are currently developed with existing DCIA of less than 40%, or any new stormwater discharges located within 500 feet of tidal wetlands.

Design Criteria:

$$WQV = \frac{(P)(R)(A)}{12}$$

W= water quality volume (cubic feet)
P= 1.3 inches (90th percentile rainfall event)
R= volumetric runoff coefficient = 0.05+0.009*I*
I= post-development impervious area (percent) after application of non-structural LID site planning and design strategies and before application of structural stormwater BMPs
A= post-development total drainage area of site or design point (square feet)

Volume to be Treated:

Pre-development Impervious Area=	0.00	acre
Post-development Impervious Area=	0.87	acre
Area to Filter=	1.01	acre
I=	**86.0928**	%
R=	0.8248	

WQV= **3,370** **ft^3**

Volume Provided:

Required Retention Volume (100% of WQV) = 0.08 ac
Total Impervious area treated through BMPs = **0.58 ac** ok

Infiltration Basin
Total Volume = **ft^3**

Provided Volume:

Designation	Volume Required (ft^3)	Volume Provided (ft^3)
Subsurface Chambers	**3,370**	

SAND FILTER SIZE CALCULATIONS - AREA 1

Date: January 23, 2025
Project: HVN
Project No:
Location: New Haven, CT

Prepared By: Date: 1/23/2025
Checked By: Date:
Objective: To size a sand filter per CTDOT requirements

Methodology: Calculations are in accordance with methods described in the Connecticut Stormwater Quality Manual (March 2024)
Chapter 10 - General Design Guidance for Stormwater Infiltration Systems

Design Criteria:

$$A(req) = \frac{(WQV)\,(d)}{[(k)(t)(h+d)]}$$

A(req)=	minimum required surface area of filter bed (square feet)
WQV=	water quality volume (cubic feet)
d=	filter bed depth (feet)
k=	hydraulic conductivity of filter media (ft/day)
t=	time for the water quality vol ume to drain from the system (24 hours)
h=	average height of water above filter bed during water quality design storm

Volume to be Treated:

WQV=	3,535	**ft^3**	
d=	1.5	**ft**	
k=	20	**ft/day**	medium sand
t=	0.5	**day**	
h=	2	**ft**	

A(req)= 151 ft2
SAY: **160 ft2** Length (ft) 20 Width (ft) 8

Pretreatment:

$$A(s) = \frac{-(Q/W)\ \ln(1-E)}{}$$

A(s)=	sedimentation surface area (square feet)
Q=	discharge rate from drainage area (cubic feet/second) (WQV/24hr)
W=	particle settling velocity (0.0004 ft/s reccomended for silt)
E=	sediment removal efficiency (assume 0.9 or 90%)

Q=	0.0017	**ft^3/s**	
W=	0.0004	**ft/day**	medium sand
E=	0.9	**hours**	

A(s)= 10 ft2
SAY: **40 ft2** 25% Minimum
Length (ft) 10 Width (ft) 4

WATER QUALITY VOLUME CALCULATIONS (AREA 2)

Date: December 10, 2024

WATER QUALITY VOLUME CALCULATIONS (AREA 6)

Date: December 10, 2024
Project: HVN
Project No:
Location: New Haven, CT

Prepared By: Date: 1/6/2025
Checked By: Date:

Objective: To determine the required Water Quality Volume (WQ_V) for adequate stormwater treatment

Methodology: Calculations are in accordance with methods described in the Connecticut Stormwater Quality Manual (March 2024) Appendix D - Water Quality Flow Calculation Method. Per Table 4-1 Stormwater Management Standards and Performance Criteria Summary, Required Retention Volume (RRV) is 100% of the site's Water Quality Volume (WQV) for all new development, redevelopment or retrofit of sites that are currently developed with existing DCIA of less than 40%, or any new stormwater discharges located within 500 feet of tidal wetlands.

Design Criteria:

$$WQV = \frac{(P)\,(R)\,(A)}{12}$$

W= water quality volume (cubic feet)
P= 1.3 inches (90th percentile rainfall event)
R= volumetric runoff coefficient = 0.05+0.009*I*
I= post-development impervious area (percent) after application of non-structural LID site planning and design strategies and before application of structural stormwater BMPs
A= post-development total drainage area of site or design point (square feet)

Volume to be Treated:

Pre-development Impervious Area=	1.42	acre
Post-development Impervious Area=	3.62	acre
Area to Filter=	3.93	acre
I=	**92.1419**	%
R=	0.8793	
WQV=	**15,016**	**ft^3**

Volume Provided:

Required Retention Volume (100% of WQV) = 0.34 ac
Total Impervious area treated through BMPs = 0.58 ac ok

Infiltration Basin
Total Volume = ft^3

Provided Volume:

Designation	Volume Required (ft^3)	Volume Provided (ft^3)
Subsurface Chambers	**15,016**

Outlet Control Calculations

Airport: Tweed New Haven Regional Airport
Project: Runway Extension and Terminal Expansion

Task Size stormwater outlet protection measures (rip-rap) using CT DOT Drainage Manual, Chapter 11
10-year storm, data from post-development HydroCAD model

Outlet	Description	Type	Tailwater	Flow (cfs)	Velocity (fps)	Rip-rap type
1	3 - 35" x 24" CMP Arch	C	Maximum	49.24	4.02	Modified

From the CT DOT Drainage Manual: (Page 11.13-3)

Type C Riprap Apron - The length of a Type C Riprap Apron shall be determined using the formula for a Type B Riprap Apron.

L_a = length of apron, m (ft)
S_p = inside diameter for circular sections or maximum inside pipe span for non-circular sections, m (ft)
Q = pipe (design) discharge, cms (cfs)
TW = tailwater depth, m (ft)
R_p = maximum inside pipe rise, m (ft)
Note: $S_p = R_p$ = inside diameter for circular sections

Type B Apron (Maximum Tailwater Condition) TW ≥ 0.5 R_p

$$L_a = \frac{5.44(Q-0.142)}{S_P^{1.5}} + 3.05 \qquad \left(L_a = \frac{3.0(Q-5)}{S_P^{1.5}} + 10 \right) \qquad \textbf{(11.32)}$$

Type C Riprap Apron

For a Type C Riprap Apron when there is a well defined channel downstream of the outlet, the bottom width of the apron should be at least equal to the bottom width of the channel and the lining should extend on the channel side slopes at least 0.3m (1 ft) above the tailwater depth (TW) or at least two-thirds of the vertical conduit dimension (0.7 R_p) above the invert, whichever is greater. (In all cases, the overall width of the apron shall be a minimum of $3S_p$). See Figure 11-13.

	CMP Arch	3 - 35" x 24"	
	Sp =	8.75	ft
	Rp =	2.00	ft
	Q =	49.24	cfs
Per Table	La =	15.13	ft
(11-13.1)	La (min) =	22.00	ft
	Cb =	8.75	ft
	W3 =	26.25	ft
	d =	12.00	in

Outlet Protection

Location: Culverts

Preformed Scour Hole
Per CTDOT Drainage Manual Section 11.13.6

Empirical Preformed Scour Hole Equations:

Type 1: Scour Hole Depression = one-half pipe rise, m (ft)

$d_{50} = (0.0276\ R_p^2/TW)\ (Q/R_p^{2.5})^{1.333}$ ($d_{50} = (0.0125 R_p^2/TW)\ (Q/R_p^{2.5})^{1.333}$) **(11.35)**

Type 2: Scour Hole Depression = full pipe rise, m (ft)

$d_{50} = (0.0181\ R_p^2/TW)\ (Q/R_p^{2.5})^{1.333}$ ($d_{50} = (0.0082 R_p^2/TW)\ (Q/R_p^{2.5})^{1.333}$) **(11.36)**

d_{50} = median stone size required, m (ft)

For variables S_p, R_p, TW and Q, see Section 11.13.5.

Type 1 and 2 preformed scour hole dimensions (See Figure 11-15)

$C = 3S_p + 6F$	Basin Length m (ft)	
$B = 2S_p + 6F$	Basin Inlet and Outlet Width m (ft)	**(11.37)**
$F = 0.5R_p$ (Type 1) or R_p (Type 2)	Basin Depression m (ft)	

Table 11-14 solves the above set of equations for Type 1 and 2 preformed scour holes for various pipe sizes.

The type of riprap required is as follows:

Modified	$d_{50} < 0.13$m (0.42 ft)
Intermediate	0.13m (0.42 ft) $< d_{50} <$ 0.20m (0.67 ft)
Standard	0.20m (0.67 ft) $< d_{50} <$ 0.38m (1.25 ft)
Special Design	0.38m (1.25 ft) $< d_{50}$

OUTLET PROTECTION
OUTLET VELOCITY > 14 feet/sec or Length of Apron exceeds limits shown on Tables 11-12.1 and 11-13.1

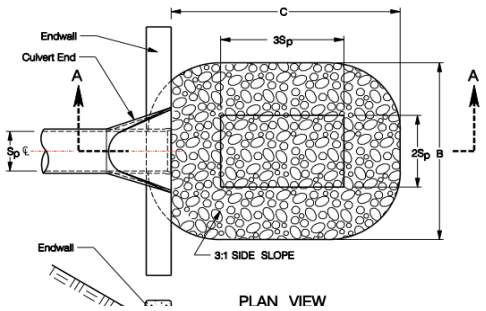
Table 11-14.1 - Dimensions of Preformed Scour Hole (Feet)



PLAN VIEW

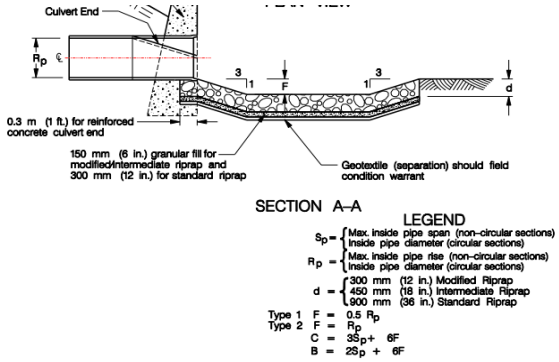


Figure 11-15 Preformed Scour Hole Type 1 and Type 2

Type 1 Riprap Type:

	DESIGN (25-yr)	Check (-yr)	
Rp* (ft) =	6		
Sp* (ft) =	3		
TW (ft) =	0.97		
Q (cfs) =	66.50		
d50 (ft)	0.32		#DIV/0!
Riprap =	**Modified**		#DIV/0!

Using largest culvert dimensions to be conservative, analyzing for flow through one culvert

Type 2 Riprap Type:

	DESIGN (25-yr)	Check (-yr)	
Rp* (ft) =	6		
Sp* (ft) =	3		
TW (ft) =	0.97		
Q (cfs) =	66.50		
d50 (ft)	0.46		#DIV/0!
Riprap =	**Intermediate**		#DIV/0!

TW depth calculated by subtracting the downstream depth from the depth at inlet of culverts

Scour Hole Dimensions:

	Type 1
F (ft) =	3
C (ft) =	27
B (ft) =	24

	Type 2
F (ft) =	3
C (ft) =	27
B (ft) =	24

***Per table 11.14-1, Use Type 2 Scour Hole**
B= width of channel wingwall to wingwall downstream of the culverts based on engineering judgement; B=58'

Outlet Protection

Location: Outfall of Stormwater Pump Stations

Outlet Protection Riprap Size:

Table 11.11 Allowable Outlet Velocities for Type A and B Riprap Aprons

Outlet Velocity - mps (fps)	Riprap Specification
0-2.44 (0-8)	Modified
2.44-3.05 (8-10)	Intermediate
3.05-4.27 (10-14)	Standard

The smaller pump station:

Footprint dimensions = 14'4" x 34'
Flow Velocity w/ 1 pump running (Q = 25 cfs): V = 6.64 ft/s
Flow Velocity w/ 2 pumps running (Q = 50 cfs): V = 8.32 ft/s
Flow Velocity w/ 3 pumps running (Q = 75 cfs): V = 9.39 ft/s
*assumed a channel slope of 0.5%

V (ft/s) = 9.39
Riprap = Intermediate
*Worst case scenario V used for rip rap determination

The larger pump station:

Footprint dimensions = 14'4" x 35'
Flow Velocity w/ 1 pump running (Q = 40 cfs): V = 9.35 ft/s
Flow Velocity w/ 2 pumps running (Q = 80 cfs): V = 11.83 ft/s
Flow Velocity w/ 3 pumps running (Q = 120 cfs): V = 13.45 ft/s
*assumed a channel slope of 1.0%

V (ft/s) = 13.45
Riprap = Standard
*Worst case scenario V used for rip rap determination

Using Intermediate Riprap

CTDOT 2000 DRAINAGE MANUAL - APPENDIX C

6.C.4 Sheet-Flow Travel Time, T_t

Sheet flow is a shallow mass of runoff on a plane surface with the depth uniform across the sloping surface. **Typically flow depths will not exceed 30mm (1 in). Such flow occurs over relatively short distances, rarely more than about 91.4m (300 ft), but most likely less than 46m (150 ft)**. Sheet flow rates are commonly estimated using the NRCS TR-55 (1986) variation of the kinematic wave equation:

$$T_t = \frac{0.091(nL)^{0.8}}{P_2^{0.5} S^{0.4}} \qquad \left(T_t = \frac{0.007(nL)^{0.8}}{P_2^{0.5} S^{0.4}} \right) \qquad \textbf{(6.C.2)}$$

Where T_t = travel time, h
n = Manning's roughness coefficient (values of n can be obtained from Table C.1)
L = flow length, m (ft)
S = slope of the hydraulic grade line (land slope), m/m (ft/ft)
P_2 = 2 year, 24 hour rainfall depth, mm (in) (See Table B-1.)

1. Project Description

The Tweed New Haven Airport Authority (TNHAA) was created in 1998 by the State of Connecticut (CGS 15-120i) to manage and operate Tweed New Haven Regional Airport (HVN). TNHAA has full control of the operation and management of the airport, including land, buildings and easements by virtue of a lease to the Authority by the City of New Haven, which owns the airport. On August 19, 2022, the Authority entered into a long-term Lease & Development Agreement with The New HVN, LLC. TNHAA and The New HVN LLC are co-applicants for this project.

The applicants propose the extension of Runway 02-20, drainage improvements and the replacement of the existing West Terminal with a new terminal ("East Terminal") on previously disturbed land on the east side of the Airport property. Additional elements associated with the East Terminal include associated roadways, parking lots, aprons and taxiways.

The proposed runway improvements (extension and drainage) include:

- Extension of Runway 02-20, which entails approximately an additional 639 feet at Runway 02 end and 336 feet at Runway 20 end.
- Adjusting runway cross-section and profile to be compliant with FAA standards.
- Strengthen existing the runway to meet pavement design requirements of the existing aircraft fleet.
- Incidental grading, stormwater drainage and markings.
- Adjusting and calibrating navigation aids for both runway ends.
- Installing runway edge lighting, guidance signs, and other accessory features to fully comply with FAA design standards.

The proposed East Terminal development includes:

New East Terminal Building

- Construction of a new terminal building ("East Terminal") on the east side of the Airport with an approximate gross square footage (SF) (functional area) of 80,000 SF, with four gates and two additional boarding positions (6 total, all ground boarding).
- Installation/relocation of security fencing and access gate.
- Incidental site work, including grading, stormwater management system and connection to existing on-site utilities such as electricity, water, wastewater, telephone and internet, and site work activities.

New Apron at East Terminal

- Construction of a new aircraft apron, with an area of approximately 450,000 SF, including ancillary site elements, would include two Remain Overnight (RON) parking positions and six gate parking positions.
- Construction of two access taxilanes from the terminal apron to an extended Taxiway A.
- Incidental site work, including deicing pads, blast deflector fence, grading, stormwater management system and utilities.
- Removal of a FAA owned decommissioned very high frequency omni-directional range (VOR).

New Vehicle Parking and Access Road

- Construction of approximately 2,000 new parking spaces with an approximate footprint of 1,042,000 SF, including building support areas, to serve the new East Terminal.
- Construction of a causeway and new two-lane, with potential to expand to four lane, airport access road from Proto Drive and associated improvements.
- Installation of electrical lighting, wayfinding, signage, landscaping associated with new parking.
- Incidental site work, including grading, stormwater management system and utilities.

Wetland Mitigation that will be included as part of the overall project to address wetland impacts will include enhancement of 28.5 acres of tidal salt marsh complex within existing Phragmites-dominated marsh areas by increasing the depth and duration of inundation of tidal water within these marshes. The enhancement objectives will be primarily achieved by modifying the operational procedure of the existing tide gate. The storm event / wet weather operations procedure of the tide gate will remain unchanged, ensuring flood prevention through the use of the Watershed Drain Mode when severe weather is forecast. Mitigation will also include the creation of 3.61 acres of tidal salt marsh complex within upland areas of the Airport property dominated by Phragmites australis. This process will involve excavating existing upland material, ensuring tidal flow through the creation of tidal channels that connect with existing channels, placing a clean, sandy planting medium, and grading the site to appropriate elevations for tidal inundation—the upper quarter of the tidal cycle. The newly created marsh will be planted with native salt marsh vegetation, including Spartina alterniflora in low marsh zones, to support habitat function and ecological resilience.

The project takes into consideration the Airport's location within the 100-year floodplain. The Federal Flood Risk Management Standard (FFRMS) has been used to determine the flood design class of the proposed buildings and structures. The proposed East Terminal will be designed to the Freeboard Value Approach of Base Flood Elevation (BFE) plus 2 feet for the minimum elevation of

bottom of lowest supporting horizontal structural member of lowest floor (elevation 14 ft (NAVD88)). To achieve this, the proposed East Terminal will be constructed on piers with the space below the finished floor elevation left open to allow floodwater to pass. Escalators and other non-structural components will be designed as breakaway wall(s). The project will incorporate resiliency measures, such as placing key building mechanical systems in a raised mezzanine or roof top location where they would be above flood elevation, and site design considerations to promote drainage and make facilities flood resistant. Additionally, the project would take place within the airport property and within an existing airport dedicated easement. The new access road would connect with existing Proto Drive; therefore, limited construction would occur within public rights-of-way which mainly entails roads in the immediate vicinity of the Airport. No private property is intended to be acquired as part of the project.

2. Watershed Description

The project study area for the Tweed New Haven Regional Airport Runway Extension and Terminal Expansion Project is located within the southern portion of the Tuttle Brook-Morris Creek watershed. The Tuttle Brook-Morris Creek watershed is located within New Haven and East Haven Connecticut and drains approximately 2,600 acres (4.1 sq mi). The watershed outlets directly into Long Island Sound near Lighthouse Point Park; therefore, the downstream end of the watershed is subject to tidal flow and has a tide gate located approximately 3,500 ft upstream of Long Island Sound. The Tuttle Brook tributary drains approximately 1,913 acres (3.0 sq mi). The Tuttle Brook watershed extends northerly from the Tweed New Haven Airport and extends past the I-95 Connecticut Turnpike. The Morris Creek tributary drains approximately 723 acres (1.1 sq mi) at the confluence with Tuttle Brook. The Morris Creek watershed extends north-easterly from the Tweed New Haven Airport and is approximately bounded by Cove Ave/Hemingway Ave and Main St. See Watershed Map included in Appendix A.

The watershed is heavily developed with commercial, industrial, and residential land cover. Notable features of the watershed include a tide gate, East Haven Industrial Park, Tweed New Haven Airport, and extensive marshes ranging from saltwater tidal marshes to freshwater nontidal swamps. The project study area is located within a mapped FEMA Zone AE, predominantly a Coastal A Zone, therefore the Flood Insurance Study (FIS) for New Haven County, Connecticut (dated May 16, 2017) includes both a riverine and coastal analysis near the project site.

3. FEMA History

At the start of the analyses of these projects, the effective Flood Insurance Rate Map (FIRM) in the vicinity of the Tweed New Haven Airport site was Map Number 09009C0444J (effective date July 8, 2013). The 2013 map showed a mapped floodway for Tuttle Brook with a floodway limit extending to cross section A-A located near Dodge Avenue. However, that map did not incorporate a previously effective LOMR from 2012 (Map Number 09009C0444H, effective date December 17, 2010, CLOMR effective date October 5, 2012). The 2012 LOMR was associated with the Tweed New Haven Airport Safety Improvements Project. Hoyle Tanner and Associates (Hoyle Tanner) was the engineer which applied for the CLOMR/LOMR for that project. The Safety Improvements Project relocated Dodge Avenue, relocated the stream channel near Dodge Avenue, and added dual culverts under the relocated Dodge Avenue. The 2012 LOMR also determined the floodway limit was located further upstream near Forest Street. FEMA terminates regulatory floodways at the boundary of the VE or V Zone; therefore, the floodway limit reflects the upper limit of the coastal analysis and the downstream end of the riverine analysis. The 2012 CLOMR/LOMR was obtained by documenting a "no rise" scenario with the Post-Project conditions model which is required for floodway impacts. FEMA approved the floodway limit ending near Forest Street and other associated project changes for Map Number 09009C0444H.

Hoyle Tanner and Connecticut Department of Energy and Environmental Protection (CTDEEP) have been coordinating with FEMA about the discrepancy in historical FIRMs and FEMA initiated an internal LOMR process (Case #24-0-0496P) to update the current FIRM. FEMA issued the preliminary LOMR on August 28, 2024 with an effective date of January 10, 2025. During the open comment period of the preliminary LOMR, Hoyle Tanner appealed to FEMA with questions pertaining to the BFE elevations displayed on the preliminary LOMR for the Tuttle Brook Cross Sections located between A and D to verify they match the results of the 2012 LOMR model. FEMA initiated a LOMR to resolve the appeal (Case #25-01-0643X) with a final letter of determination expected, at the earliest, within 90 days of March 10, 2025. During the processing of the appeal, Hoyle Tanner is referencing the 2012 LOMR 1D HEC-RAS model as the effective riverine model. The currently effective 2025 LOMR FIRM, the previously effective FIRM, and the historical 2012 LOMR FIRM are provided in Appendix B. The 2012 LOMR 1D HEC-RAS model is included separately from this report.

The Runway Extension and Terminal Expansion Project site is located completely within the coastal influence of Long Island Sound between FEMA Transects 22 and 24 with all proposed project work occurring within FEMA Transect 23. The project site is located approximately 1,100 ft downstream of the 2012 LOMR designated floodway limit. The BFE, as shown on the FIRM, is elevation 11 ft and 12 ft within the project site. There are a significant number of residential homes

impacted by the BFE limits. There is also a Limit of Moderate Wave Action (LiMWA) line immediately adjacent to the airport site.

4. Means and Methods

Extensive ground survey, bathymetry, and drone survey were obtained for this project. Publicly available LiDAR data was also downloaded from UCONNN (2016 LiDAR Download dataset). All field survey and LiDAR data are relative to NAD83 (2011) CT State Plane coordinates and NAVD88 elevations.

In meetings with CTDEEP and FEMA, it was determined both a riverine and coastal analysis would be beneficial for analyzing the project impacts. There are no proposed changes within the floodway of Tuttle Brook; however, due to the close vicinity of the floodway limit to the proposed project limits, a riverine analysis is needed to ensure the riverine backwater effects on the floodway will not be adversely impacted by the proposed projects. The riverine impacts of the proposed projects were determined utilizing a Hydrologic Engineering Center's River Analysis System (HEC-RAS, version 6.4.1) 2D model. Hoyle Tanner referenced the accepted 2012 LOMR HEC-RAS 1D model for the effective riverine analysis. The effective coastal analysis report and supporting modeling were requested and obtained from FEMA for the analysis completed in July 2013. The coastal impacts of the proposed projects were determined by analyzing the overland wave heights using the Wave Height Analysis for Flood Insurance Studies (WHAFIS) software within the Coastal Hazard Analysis for Mapping Program (CHAMP) following the methodology described in the FEMA Guidelines and Specifications for each coastal transect impacted by the development. Additional details about the modeling inputs and boundary conditions for the FEMA models are detailed in Sections 5 and 6 below.

5. FEMA Coastal Model

In coastal areas, flooding is exacerbated by wave action. The proposed project development occurs directly within Transect 23 of the FEMA FIS coastal analysis – therefore the direct effect of the proposed project on coastal flooding due to wave action can be determined. Streamworks PLLC was a subcontractor to Hoyle Tanner which performed the WHAFIS analysis. A summary of the WHAFIS model runs and results are below:

- **Duplicate Effective Model:** WHAFIS model obtained from FEMA containing terrain information from 2011.
- **Corrected Effective Model:** The duplicate effective model did not contain terrain information associated with the channel modifications associated with the 2012 LOMR.

Therefore, a Corrected Effective model was developed using updated topography from the project survey and bathymetry and supplemented with 2016 CT LiDAR information. This Corrected Effective model is also the **Pre-Project (Existing) Conditions Model**.

- **Post-Project Conditions Model**: The Corrected Effective/Pre-Project Conditions model was revised to include the proposed runway and East Terminal grading modifications as well as the proposed terminal pile design.

The WHAFIS model results show no change between the Corrected Effective/Pre-Project Conditions Model and the Post-Project Conditions Model therefore the proposed development does not change coastal flood hazards due to wind-generated waves. This includes no change to the LiMWA boundary as a result of the project activities. See Appendix C for a plan view and profile of the WHAFIS transect through the project site as well as a memo from Streamworks which includes the in-depth coastal analysis and supporting documentation.

6. FEMA Riverine Models

6.1 Hydrology

The FEMA FIS contains a Frequency Discharge-Drainage Area Curve for Morris Creek – Tuttle Brook. The curves define the 10-, 50-, 100-, and 500-year peak flows. These peak flows were used in the 2012 LOMR analysis and will also be used in this analysis.

Table 1: FEMA Peak Flows

Storm Event	10 year	50 year	100 year	500 year
FEMA Peak Flow (cfs)	830	1150	1360	1860

6.2 Hydraulic Model Development

Hoyle Tanner referenced the accepted 2012 LOMR HEC-RAS models for the effective riverine analysis. The 2012 LOMR models include: the HEC-2 files effective in 2012 obtained from FEMA; a 1D HEC-RAS Duplicate Effective model; a 1D HEC-RAS Corrected Effective/Pre-Project Conditions model; and a 1D HEC-RAS Post-Project Conditions model.

A 2D HEC-RAS model was chosen for the analysis of the proposed runway and East Terminal modifications because the floodplain in this area is very wide and flat with several channels and/or culverts overtopped during the base flood event. This creates extensive overland flow

which is better represented in a 2D versus 1D HEC-RAS model. The extensive survey and bathymetry obtained for this project as well as the supplemental 2016 LiDAR information makes for a very robust and comprehensive terrain input for the 2D model. A summary of the riverine model runs is below:

- **Duplicate Effective Model:** The Post-Project Conditions 1D HEC-RAS model from the 2012 LOMR for the Safety Improvements Project.
- **Corrected Effective Model:** A 2D HEC-RAS model was developed using updated topography from the project survey and bathymetry and supplemented with 2016 CT LiDAR information. There have been no additional changes to the floodplain of floodway area since the Safety Improvements Project associated with the 2012 LOMR; therefore, this Corrected Effective model is also the **Pre-Project (Existing) Conditions Model**.
- **Post-Project Conditions Model**: The Corrected Effective/Pre-Project Conditions model was revised to include the proposed runway and East Terminal grading modifications.

6.3 Hydraulic Study Area

The hydraulic study area encompasses similar stream limits for Tuttle Brook as the 2012 LOMR model with the upstream limit of this study located near Forest Street. The study area in HEC-RAS consists of approximately 179 acres. The study area extends from just upstream of the existing Tweed New Haven parking lot culvert (XS 127+34) to approximately 80 ft upstream of FEMA Section C-C (XS 153+80) (See Cross Section Map in Appendix D).

6.4 Flood Events

The study included analyses of the 10-, 50-, 100-, and 500-year peak flood events for Tuttle Brook listed in Table 1. Separate HEC-RAS 2D flow models were created for each of those events.

6.5 Geometry

Pre-Project model geometry was developed with a combination of field survey data, field bathymetry data, and publicly available LiDAR data. Field survey and bathymetry were completed by Langan. All field survey, bathymetry, and LiDAR data are relative to NAD83 (2011) CT State Plane coordinates and NAVD88 elevations. Field survey and bathymetry data were merged with LiDAR data to produce a comprehensive Pre-Project DEM which covers the entire study area.

There have been no modifications to the floodplain or channel since the effective model of the 2012 LOMR; therefore, the Corrected Effective model is the same as the Pre-Project model. The project bathymetry extends approximately 800 feet upstream of the Dodge Avenue dual conspan culverts. Since FEMA Section C-C was not covered by the bathymetry data, a channel modification was used in HEC-RAS so the existing channel inverts between the limits of the bathymetry data and the Forest Street culvert replicate the 2012 LOMR channel cross sections

within this location. These cross sections (XS 153+80 and 154+85) were not modified by the 2012 LOMR proposed work therefore this channel cross section data also matches the HEC-2 model data from the 2012 LOMR. This Pre-Project model geometry was copied and modified to create a separate comprehensive DEM representing the Post-Project conditions by replacing the existing terrain with terrain data that reflects the proposed runway grading limits as well as the proposed East Terminal grading limits. Note, only the proposed runway grading limits are within the limits of the FEMA riverine hydraulic study area.

A 2D computational mesh covering the hydraulic study area was created for the Pre- and Post-Project comprehensive DEMs. A default 20-ft x 20-ft cell size was specified, however smaller cells were utilized in areas near the existing culverts to better define flow dynamics. Smaller cell sizes were also used where needed in any areas with steep, shallow flow in order to better define rapid changes in terrain and flow dynamics. Breaklines were delineated along high ground and other features like stream banks in order to align cell faces with the terrain breaklines to better reflect overtopping conditions should overtopping occur. The same computational mesh layout and breaklines were used for both the Pre- and Post-Project models.

Hydraulic structures within the study area were added as 2D flow area connections. One dual culvert structure is within the study area (located near Dodge Avenue) for both the Pre- and Post-Project conditions. Hydraulic structure information was modeled using data from the field survey.

6.6 Roughness

Field survey information, field observations, and orthoimagery were used to determine existing land cover within the hydraulic study area. Polygons of each land cover were created in AutoCAD and GIS and then imported into HEC-RAS. Manning's n-values were then assigned to each land cover type in HEC-RAS. N-values were assigned based on recommended n-values published in the HEC-RAS 2D User's Manual as well as the n-values for Tuttle Brook defined in the FIS and n-values assigned in the 2012 LOMR model. Compared to the 1D model, the 2D land cover polygons have finer details (e.g. the runway pavement limits, tree limits, etc.) across the entire terrain incorporated into the 2D model. Table 2 below summarizes the land cover and corresponding n-value. The existing land cover map was then updated to reflect the revised pavement and grass limits within the project site to create the Post-Project land cover map. Occasionally when importing into HEC-RAS, some pixels between land cover boundaries may not receive a land cover designation. For any pixels that did not import with a land cover association, an n-value of 0.03 was used. Pre-Project and Post-Project land cover maps are included in Appendix E.

Table 2: Land Cover Roughness Coefficients

Land Cover	Manning's n-value
Grass	0.035
Gravel	0.03
Industrial	0.14
Pavement	0.025
Stream	0.035
Suburban	0.06
Trees	0.10
Herbaceous Wetland	0.05
Woody Wetland	0.14
No Data	0.03

6.7 Boundary Conditions

External boundary conditions were defined for the upstream and downstream study limits. FEMA guidelines are to compute flood elevations without considering backwater effects therefore the backwater effects from Long Island Sound were not considered for this analysis and normal depth was used as the downstream boundary condition. The energy grade slope used for the downstream boundary condition is the same slope used in the 2012 LOMR model (0.2%) which was verified by the project bathymetry and survey.

Unlike 1D modeling, which requires peak flood discharges, 2D modeling requires modeling flow over time therefore six synthetic 24-hour hydrographs were developed (one for each of the peak flood discharges listed in Table 1) to be used as the upstream boundary conditions in the hydraulic analysis. The 10-, 50-, 100-, and 500-year peak flows for Tuttle Brook are defined by FEMA (Table 1). The hydrograph gradually increases flow until the peak discharge value is reached. To allow water surface elevations (WSEs), depths, velocities and other parameters to stabilize, the peak flow was held for 5 hours to simulate a steady flow condition before gradually decreasing flow again.

To ensure the HEC-RAS model does not start from dry conditions, an initial condition of 1 hour was used for all models. The initial streamflow within the hydrograph was adjusted to provide enough

flow during the HEC-RAS initial conditions time to wet the main channels before HEC-RAS analyzed the storm event hydrographs.

6.8 Additional Parameters

Each flood simulation was run with the SWE-ELM equation set (full momentum) for a period of 24 hours. The program was set to allow for adjustment to the computational time step as needed to produce Courant numbers of about one or less in each cell within the mesh. This minimizes the potential for flow to move through more than one cell at each time step which increases model stability and accuracy.

7. FEMA Riverine Hydraulic Model Results

7.1 Duplicate Effective Model

The effective model is a 1D HEC-RAS model used by the 2012 LOMR.

7.2 Corrected Effective Model and Pre-Project Model

As described in Section 6.5, there have been no modifications to the floodplain or channel within the study area since the 2012 LOMR; therefore, the Corrected Effective model is the same as the Pre-project model. This 2D HEC-RAS model only updates the terrain within the study area with the most recent survey, bathymetry, and publicly available LiDAR information.

To meet FEMA requirements when using a different model program than the currently effective model program, the Corrected Effective Model must tie-in to the Duplicate Effective BFEs within 0.5 ft. The 2012 LOMR 1D cross section locations were geolocated and imported as profile lines into the 2D HEC-RAS model to ensure the results of the 1D and 2D models can be directly compared. Appendix F includes Table 3 showing compliance with this 0.5 ft difference when comparing the maximum WSE between the Corrected Effective Model and the Duplicate Effective Model for the 10-, 50-, 100-, and 500-year storm events for each of the cross sections included in the 2012 LOMR.

Note the Duplicate Effective Model and the Pre-Project Model have computed 100-year water surface elevations between FEMA cross sections A and D that are different than those reflected in the 2025 LOMR FIRM. For example, at cross section C, the 2025 LOMR FIRM depicts a water surface elevation of 9.3 ft while the Duplicate Effective Model has a computed 100-year water surface elevation of 9.6 ft. These differences are being addressed in the appeal LOMR as described in Section 3. While the appeal LOMR is processing, Hoyle Tanner is referencing the 2012 LOMR 1D HEC-RAS model as the effective riverine model.

A cross section location and inundation map for the FEMA Pre-Project 100-year and 500-year storm events is included in Appendix D (FE-1 and FE-2). The Pre-Project model shows the dual culvert near Dodge Avenue does not overtop; however, the northern end of the runway has a low area that acts as a weir for overtopping floodwaters during the 10-year storm event and greater. These overtopping waters re-enter Tuttle Brook just downstream of the dual culvert near Dodge Avenue.

7.3 Post-Project Model

The Post-Project hydraulic analysis used a terrain that incorporated the proposed runway grading within the study area and a proposed land cover map while all other modeling parameters were maintained. The Post-Project model shows the dual culvert near Dodge Avenue still does not overtop and the proposed grading at the northern end of the runway still facilitates floodwaters overtopping the runway and re-entering Tuttle Brook just downstream of the dual culvert. The Post-Project model shows there will be no adverse effect to the riverine backwater effect on the existing floodway, and therefore the riverine BFEs, by the proposed projects. The overall volume accounting error as a percentage for the HEC-RAS runs ranged from 0.005 to 0.020 which shows model stability and that the results are within the margin of error for the riverine model. Cross section location and inundation maps for the FEMA Post-Project 100-year and 500-year storm events are included in Appendix D (FE-1 and FE-2). Inundation maps comparing Pre-Project and Post-Project 100-year and 500-year water surface elevations are also included in Appendix D (FE-3 and FE-4). A summary table comparing the Corrected Effective/Pre-Project Model to the Post-Project Model WSEs is included below in Table 4.

Table 4: FEMA Corrected Effective/Pre-Project Comparison to Post-Project Water Surface Elevations

Cross Section	Model	Maximum Water Surface Elevation for Storm Event (ft, NAVD88)			
		10 year	50 year	100 year	500 year
XS 127+34	Corrected Effective/Pre-Project	6.90	7.47	7.79	8.36
	Post-Project	6.78	7.32	7.64	8.20
	Difference (Post-Project - Pre-Project)	-0.12	-0.16	-0.15	-0.16
XS 131+00	Corrected Effective/Pre-Project	7.17	7.77	8.07	8.63
	Post-Project	7.10	7.67	7.95	8.50
	Difference (Post-Project - Pre-Project)	-0.07	-0.10	-0.11	-0.13
XS 136+50	Corrected Effective/Pre-Project	7.26	7.88	8.18	8.75
	Post-Project	7.20	7.78	8.08	8.65
	Difference (Post-Project - Pre-Project)	-0.07	-0.09	-0.10	-0.10
XS 139+10	Corrected Effective/Pre-Project	7.49	8.09	8.39	8.94
	Post-Project	7.43	8.02	8.31	8.85
	Difference (Post-Project - Pre-Project)	-0.06	-0.07	-0.08	-0.09

	Post-Project	8.37	9.17	9.52	10.16
	Difference (Post-Project - Pre-Project)	-0.04	-0.03	-0.04	-0.05
XS 153+80	**Corrected Effective/Pre-Project**	8.92	9.64	9.97	10.60
	Post-Project	8.89	9.62	9.95	10.57
	Difference (Post-Project - Pre-Project)	-0.03	-0.02	-0.02	-0.03

8. FEMA Conclusion

Both the coastal analysis and the riverine analyses show the proposed development will not have an adverse effect on the BFEs and the project will meet NFIP minimum requirements as well as local floodplain requirements. A CLOMR will be pursued for this project in order to ensure the results of the coastal analysis and the riverine analysis are acceptable to FEMA before construction begins and to allow the municipalities of New Haven and East Haven to review the analyses before construction. The 2D HEC-RAS models and WHAFIS models are being submitted separately from this report.

9. Hydraulic Models for Inundation Maps

CTDEEP Land and Water Resource Division (LWRD) applications require existing and proposed inundation maps for the 2-, 10-, 25-, 50-, and 100-year discharges carried to convergence. The HEC-RAS 2D model created for FEMA regulations (as outlined in the section "FEMA Riverine Model" was extended to encompass the entire airport property, the tide gate, and surrounding area with a downstream limit approximately 1,290 ft downstream of the existing tide gate. The inundation maps for the 2-, 10-, 25-, and 50- year storm events included in Appendix I are results from the riverine analysis only and reflect the modeling parameters as outlined in Section 9.1-9.9. The 100-year floodplain is regulated by FEMA as well as state and local regulations; therefore, the coastal analysis results, as outlined in Sections 3 and 5, were used to depict the 100-year inundation map included in Appendix I.

9.1 Hydrology

Since the FEMA FIS hydrology does not extend beyond the Tuttle Brook floodway limit, peak riverine flows for this hydrologic study of Tuttle Brook and Morris Creek were computed for the 2-, 10-, 25-, 50-, 100-, and 500-year floods utilizing approved methods outlined in the ConnDOT Drainage Manual (Chapter 6 Hydrology). Methods include the USGS web application StreamStats, the USGS three-variable "Urban" Regional Regression Equations, the USGS seven-variable "Urban" Regional Regression Equations, and HydroCAD (which utilizes the TR-55 and TR-20 methods).

Drainage areas for Tuttle Brook (to the Tide Gate) and Morris Creek (to the confluence with Tuttle Brook) were delineated using existing contour information obtained from Connecticut Statewide LiDAR (2016) as well as project specific LiDAR and bathymetry data that was obtained from surveying the project site and adjacent stream channels. Land cover was determined using the City of New Haven, Connecticut Zoning Maps (effective date March 21, 2007, latest revision of November 16, 2012), the Zoning Map of the Town of East Haven Connecticut (dated November 15, 1998), and aerial imagery (Bing Maps, Microsoft. Retrieved April 10, 2024). Hydrologic soil types were delineated using the USDA Natural Resources Conservation Service (NRCS) Web Soil Survey (WSS). A watershed map is included in Appendix A. Zoning maps and a HSG map are included in Appendix G. Weighted runoff curve numbers were determined based on this land cover and hydrologic soil group (HSG) information. Table 5 below summarizes the curve numbers used for the various land covers and HSG.

Table 5: Land Cover Curve Numbers based on Hydrologic Soil Group

Land Cover (Good Condition)	HSG A	HSG B	HSG C	HSG D
Impervious	98	98	98	98
Commercial	89	92	94	95
Industrial	81	88	91	93
Park (Open Space)	39	61	74	80
Residential ¼ Acre	61	75	83	87
Residential ½ Acre	54	70	80	85
Water	98	98	98	98

The 24-hour (Type III) precipitation frequency datasets from NOAA's National Weather Service (NWS) Atlas 14 (New Haven Tweed AP, Site ID 06-5273) and Northeast Regional Climate Center (NRCC) were obtained and compared. As shown in Table 6 below, NRCC and Atlas 14 data were similar for the majority of the storm events therefore the Atlas 14 data was utilized in order to match the explanatory variables used in the USGS Regression Equations.

Table 6: 24-hour (Type III) Precipitation Frequency Estimates

	Return Frequency	2 Year Event	10 Year Event	25 Year Event	50 Year Event	100 Year Event	500 Year Event
NOAA NWS Atlas 14	24 hours	3.42 inches	5.22 inches	6.34 inches	7.17 inches	8.07 inches	10.8 inches
NRCC	24 hours	3.28 inches	4.82 inches	6.02 inches	7.12 inches	8.43 inches	12.51 inches

StreamStats: StreamStats is a web application developed by the USGS and which utilizes an assortment of Geographic Information Systems (GIS) analytical tools to delineate drainage areas based on user selected stream points and determine peak flows based on the basin characteristics determined from the available GIS data. Although StreamStats utilizes USGS Regression Equations to determine peak flows, the values returned by StreamStats were much lower than other methods. This could be due to the mean basin elevation for the project site being

below the minimum limit of 168 ft required by the USGS equations. This parameter is used for estimating flood flows in urban basins therefore the subcatchment results obtained from the USGS Regression Equations were extrapolated with unknown errors. StreamStats flows will not be utilized for this hydraulic analysis.

USGS "Urban" Regional Regression Equations: Both the 3-Variable and 7-Variable regression equation methods were analyzed. For both methods, the Nonurban ("Rural") flows were determined for the 2-, 10-, 25-, 50-, 100-, and 500-year storm events using equations outlined by the USGS publication by Ahearn and Hodgkins[1]. Those results were used to determine the "Urban" flows for each storm event using the equations outlined by the USGS publication by Ahearn[2]. These are the most recent updates and publications to the approved ConnDOT U.S.G.S Regression Equation method previously developed by L.A. Weiss.

All subcatchments analyzed have hydrologic characteristics that fall within the range of maximum and minimum values for the regional regression equations for estimating the "rural" flood discharges in Connecticut.

NRCS WSS was used to compute the percentage of drainage area classified as HSG C, C/D, and D for use in the USGS Regression Equation. Due to the project site having a close proximity to the coast and tidal influences, soil classifications of A/D and B/D were also conservatively included in this percentage. The computed percentage of 48% matches the value given in the StreamStat report for Dodge Avenue and was therefore considered a reasonable assumption.

The average percent impervious values from TR-55 were used to determine the impervious cover of the watershed land covers. The NRCS WSS classification of water was used to determine the Drainage-basin storage variable. LiDAR contours were used to determine main channel slope. The Basin Development Factor (BDF) for the USGS "Urban Regional Regression Equations was determined for each third of the drainage area.

The USGS 7-Variable "Urban" Regression Equation results will be utilized for the hydraulic analysis. The USGS 3-Variable "Urban" Regression Equations computed the highest flows of the three methods. The 7-Variable "Urban" Regression Equation results appear to better represent the contributing watershed and amount of wetland storage available and will therefore be utilized for the analysis. Since land cover was determined via zoning maps, the same peak flows are used for both the Pre-Project and Post-Project inundation analysis. Table 7 below summarizes the results from all hydrologic methods. Supporting computations are included in Appendix H.

Table 7: Summary of Hydrologic Method Results

Hydrologic Method	Subcatchment	2 Year Event (cfs)	10 Year Event (cfs)	25 Year Event (cfs)	50 Year Event (cfs)	100 Year Event (cfs)	500 Year Event (cfs)
StreamStats	Tuttle Brook at Tide Gate	147	348	484	598	727	1090
StreamStats	Morris Creek at confluence with Tuttle Brook	55	132	184	228	277	412
USGS 3-Variable "Urban" Regional Regression Equations	Tuttle Brook at Tide Gate	459	651	796	929	1118	1512
USGS 3-Variable "Urban" Regional Regression Equations	Morris Creek at confluence with Tuttle Brook	146	222	277	325	389	537
USGS 7-Variable "Urban" Regional Regression Equations	Tuttle Brook at Tide Gate	378	593	715	834	995	1413
USGS 7-Variable "Urban" Regional Regression Equations	Morris Creek at confluence with Tuttle Brook	129	207	250	294	349	504

9.2 Hydraulic Model Development

A 2D HEC-RAS model was chosen for the analysis of the proposed runway and East Terminal modifications because the floodplain in this area is very wide and flat with several channels and/or culverts overtopped during the base flood event. This creates extensive overland flow which is better represented in a 2D versus 1D HEC-RAS model. The site also has tidal influences from Long Island Sound and tidal fluctuations can be modeled with a 2D HEC-RAS model. The extensive survey and bathymetry obtained for this project as well as the supplemental 2016 LiDAR information makes for a very robust and comprehensive terrain input for the 2D model.

9.3 Hydraulic Study Area

The study area has the same upstream limits as the FEMA model described in Section 6, extending approximately 80 ft upstream of FEMA Section C-C (XS 153+80). The downstream limits of the study extend approximately 1,270 ft downstream of the existing tide gate. The study area consists of approximately 1,100 acres. See the CTDEEP Inundation and Cross Section Maps in Appendix I for the study limits.

9.4 Flood Events

The study included analyses of the 2-, 10-, 25-, and 50-year peak flood events computed using the USGS 7-Variable "Urban" Regional Regression Equations results listed in Table 7. Separate HEC-RAS 2D flow models were created for each of those events. As noted in Section 9 above, the 100-year inundation map reflects the FEMA coastal modeling results.

9.5 Geometry

Pre-Project (Natural Conditions) model geometry was developed with a combination of field survey data, field bathymetry data, and publicly available LiDAR data. Field survey and bathymetry were completed by Langan. All field survey, bathymetry, and LiDAR data are relative to NAD83 (2011) CT State Plane coordinates and NAVD88 elevations. Field survey and bathymetry data were merged with LiDAR data to produce a comprehensive Pre-Project DEM which covers the entire study area. There is a tide gate located on Tuttle Brook-Morris Creek located approximately 1,900 ft downstream of the end of the existing runway and project site. The tide gate was incorporated into the Pre-Project model geometry (see Section 9.6 for more information on the Tide Gate). The Pre-Project model geometry was copied and modified to create a separate comprehensive DEM representing the Post-Project (Proposed) conditions by replacing the existing terrain with terrain data that reflects the proposed runway grading limits as well as the proposed East Terminal grading limits and proposed causeway geometry. Proposed grading associated with wetland mitigation and creation has also been included as a terrain modification. There are three locations chosen for wetland creation whose final grading elevation will be equal to elevation 2.3 ft that are included in the Post-Project model using a terrain modification. The terminal building is proposed

to be built on piles with the bottom of the lowest horizontal member located at the BFE plus 2 feet; therefore, the terminal building itself has not been put into the Post-Project conditions geometry file since it is outside of the floodplain elevations but all ground grading associated with the proposed terminal building has been depicted in the Post-Project conditions geometry. The proposed East Terminal design may also include a future parking garage and elevator for an above ground walkway. To ensure the model represents all potential future aspects of the airport development, a terrain modification was used to model the potential future elevator shaft and parking garage in the Post-Project model.

A 2D computational mesh covering the hydraulic study area was created for the Pre- and Post-Project comprehensive DEMs. A default 20-ft x 20-ft cell size was specified, however smaller cells were utilized in areas near the existing culverts to better define flow dynamics. Smaller cell sizes were also used where needed in any areas with steep, shallow flow in order to better define rapid changes in terrain and flow dynamics. Breaklines were delineated along high ground and other features like stream banks in order to align cell faces with the terrain breaklines to better reflect overtopping conditions should overtopping occur. The same computational mesh layout and breaklines were used for both the Pre- and Post-Project models except for within the proposed terminal project area where separate breaklines were drawn to follow the high point of the proposed causeway.

Hydraulic structures within the study area were added as 2D flow area connections. Thirteen hydraulic structures were included in the Pre-Project model: three structures were used to define the tide gate (see Section 9.6) and one structure was used to define each of the following existing hydraulic structures for both the Pre- and Post-Project conditions: South End Road bridge, Morris Causeway culverts, Pig Farm Road culverts, access path culvert on the east side of the runway, box culverts near the intersection of Dean Street and Burr Street, bridge by the West Terminal baggage claim, box culverts near the West Terminal baggage claim, box culverts under the West Terminal, box culverts near the West Terminal parking lot, dual culverts near Dodge Avenue. All hydraulic structure information was modeled using data from the field survey with the exception of the tide gate and South End Road bridge. The tide gate was modeled from as-built plans (see Section 9.6) and the South End Road bridge was modeled from the proposed bridge replacement plans from CTDOT Project No. 43-132 dated August 17, 2021. The Post-Project model also includes a hydraulic structure for the proposed East Terminal causeway culverts for a total of fourteen hydraulic structures included in the Post-Project model. The proposed causeway and culvert design used for this analysis is from the 60% design plans.

9.6 Tide Gate

The tide gate located on Tuttle Brook – Morris Creek was constructed in 1934 by the State of Connecticut to replace an earlier structure. It was designed by the Connecticut Agricultural

Experiment Station for mosquito control (Morris Creek Flood Control Study, September 1984). This was also part of a larger program which excavated small "mosquito ditches" to drain the marsh surface and Morris Creek was dredged four feet deeper from Long Island Sound to Uriah Street. The intensive mosquito control programs began in 1912 and subsequent Public Acts of 1015 (Chapter 264) and 1917 (Chapter 402).

The tide gate is owned by the city of New Haven. It is operated by The New HVN LLC on behalf of the TNHAA. While maintaining the existing tide gate infrastructure, the tide gates were replaced in 2009 with three gates that consist of a combination of new motor-operated tide gates and flap gates. The tide gate was modified to maintain an opening of approximately 1.5 ft during "normal" flow conditions to allow the mean high tide to pass through the tide gate to inundate the former salt marsh in and around the airport. Modifications also provided a larger opening to increase the downstream flow through the structure and increased operations for flood control against tidal surges associated with coastal storms but it was not initially and is not currently designed as protection against the 100-year storm event. The tide gate consists of three openings measuring 6 ft by 10 ft. The middle gate has a flap gate to prevent negative flows from entering the riverine channel. As-built plans, which have a vertical datum of NGVD29, are included in Appendix J.

The Tweed New Haven Airport has a Standard Operating Procedures (SOP) Guideline which details the tide gate operation to be expected in anticipation of storm events. In meetings with CTDEEP, it was determined analysis for the inundation maps would be completed based on the assumption the tide gate was not operational since this is the most conservative inundation analysis. Therefore, the geometry model, as described in Section 9.5, was developed to examine inundation limits when all tide gates are completely open (the worst case scenario) with the middle tide gate still operating as a flap gate.

9.7 Roughness

Field survey information, field observations, and orthoimagery were used to determine existing land cover within the hydraulic study area. Polygons of each land cover were created in AutoCAD and GIS and then imported into HEC-RAS. Manning's n-values were then assigned to each land cover type in HEC-RAS. N-values were assigned based on recommended n-values published in the HEC-RAS 2D User's Manual as well as the n-values for Tuttle Brook defined in the FIS and n-values assigned in the 2012 LOMR model. Compared to the 1D model, the 2D land cover polygons have finer details (e.g. runway pavement limits, tree limits, etc.) across the entire terrain incorporated into the 2D model. Table 8 below summarizes the land cover and corresponding n-value. The existing land cover map was then updated to reflect the revised pavement and grass limits within the project site to create the Post-Project land cover map. Occasionally when importing into HEC-RAS, some pixels between land cover boundaries may not receive a land cover designation. For any pixels that did not import with a land cover association, an n-value of 0.03

was used. Pre-Project and Post-Project land cover maps for the CTDEEP riverine models are included in Appendix K.

Table 8: Land Cover Roughness Coefficients

Land Cover	Manning's n-value
Grass	0.035
Gravel	0.03
Industrial	0.14
Pavement	0.025
Stream	0.035
Suburban	0.06
Trees	0.1
Herbaceous Wetland	0.05
Woody Wetland	0.14
No Data	0.03

9.8 Boundary Conditions

External boundary conditions were defined for the upstream and downstream study limits. Unlike 1D modeling, which requires peak flood discharges, 2D modeling requires modeling flow over time therefore four synthetic 24-hour hydrographs were developed the 2-, 10-, 25-, and 50-year peak flows (listed in Section 9.1) to be used as the upstream boundary conditions in the hydraulic analysis. The hydrograph gradually increases flow until the peak discharge value is reached. In order to allow water surface elevations, depths, velocities and other parameters to stabilize, the peak flow was held for 5 hours to simulate a steady flow condition before gradually decreasing flow again.

In order to ensure the HEC-RAS model does not start from dry conditions, an initial condition of 7 hours was used for all models. The initial streamflow within the hydrograph was adjusted to provide enough flow during the HEC-RAS initial conditions time to wet the main channels before HEC-RAS analyzed the storm event hydrographs.

The project site is located within the tidally affected zone of Long Island Sound; however, the site sees decreased tidal impacts due to the presence of the tide gate. There is a tide gage located

west of the project site within Long Island Sound. A stage hydrograph for normal tide was downloaded from NOAA's Tides and Currents gage page for New Haven, CT - Station ID: 8465705.[3] This normal tide stage hydrograph, conservatively assuming the peak high tide is coincidental with the peak riverine hydrograph, is used as the HEC-RAS downstream boundary condition.

9.9 Additional Parameters

Each flood simulation was run with the SWE-ELM equation set (full momentum) for a period of 24 hours. The program was set to allow for adjustment to the computational time step as needed to produce Courant numbers of about one or less in each cell within the mesh. This minimizes the potential for flow to move through more than one cell at each time step which increases model stability and accuracy.

10. Hydraulic Models for Inundation Maps Results

The riverine floodplain analysis using a normal tide boundary condition for the 2-, 10-, and 25-year storm event shows there is a maximum 0.1 ft increase in WSE between Pre-Project and Post-Project conditions. The 50-year storm event shows a maximum of 0.1-0.2 ft increase in WSE between Pre-Project and Post-Project conditions. From approximately Sta. 127+35 to the upstream limits of the model, there is no change between Pre-Project and Post-Project WSEs for the 2-, 10-, 25-, or 50-year storm event. The 100-year storm event is regulated by FEMA and the NFIP; therefore, the results of the coastal analysis, as described in Section 5, were used to determine the 100-year inundation limits. As stated in Section 5, the 100-year WSE has no change between Pre-Project and Post-Project conditions; therefore, the currently effective (2025 LOMR) FEMA 100-year inundation limits are depicted on the 100-year inundation map. Inundation maps for the 2-, 10-, 25-, 50-, and 100-year storm events are included in Appendix I. Note that due to the rendering limitations of the HEC-RAS program, some areas with very shallow flow are shown to be dry; therefore, several areas on the 2-, 10-, 25-, and 50-year storm event inundation maps, especially near the fringe of the floodplain, show as isolated wet pockets.

Unlike a 1D model which gives a single maximum WSE result, the 2D HEC-RAS model computes a WSE for each cell; therefore, the results need to be analyzed closely for local areas within the floodplain that may have a greater increase (or decrease) in WSE between Pre-Project and Post-Project conditions. These local increases can be due to several reasons, most notably the land cover roughness coefficient or the existing/proposed grading impacting local flow patterns. Cross section locations of the 1D HEC-RAS 2012 LOMR and inundation mapping model were geolocated in the 2D HEC-RAS model and input as profile lines. A cross section map is included in Appendix I. Those profile lines, as well as the inundation limits, were used to analyze inundation impacts.

Generally, localized increases are contained within an existing wetland area or within the limits of the TNHAA property limits which does not impact existing private property or structures. A summary table is included in Appendix I. In general, for the 0.1-0.2 ft increase in the maximum WSE for the 2-, 10-, 25- and 50-year storm events, the Post-Project inundation limits impact the same existing structures as the Pre-Project inundation limits. There are a couple areas with increased potential for inundation limits to note. For the 2-year storm event, the area between Alfred Street and Nelson Street shows an increased inundation limit in the Post-Project condition in a wooded area behind residential houses. Based on Connecticut GIS and aerial imagery, there may be uninsurable building impacts (e.g. sheds). In the Pre-Project condition, these buildings and properties are currently impacted by the 10-, 25-, 50-, and 100-year storm events. Similarly, for the 2-year storm event, the area near Kirkham Street/Concord Street/Townsend Avenue shows an increased inundation limit in the Post-Project condition in a low grassed/wooded area behind residential houses. The same insurable structures in this area appear to be impacted in both Pre-Project and Post-Project conditions and they are also currently impacted by the 10-, 25-, 50-, and 100-year storm events in the Pre-Project condition. As detailed in Section 5, the proposed development will not have an adverse effect on the BFEs therefore there are no new properties impacted by the regulatory floodplain limits.

11. Inundation Map Conclusion

Although the site survey is quite robust, there are some limitations to getting accurate ground elevations via LiDAR in areas that have extremely dense phragmites. It has been noted in field visits the surveyed elevations are estimated to be up to 0.9 ft higher than actual ground elevations in areas where phragmites is too dense to navigate or survey on foot. Therefore, the HEC-RAS 2D inundation models are utilizing a conservatively higher ground elevation for computing water surface elevations and inundation extents for the 2-, 10-, 25-, and 50-year storm events. The 2D model is also conservatively assuming worst case scenario tide gate conditions where the tide gate is not functioning (tide gates are in their largest possible opening during a storm event). The storm event also conservatively assumes riverine peak flows are coincidental with peak high tide. These inundation results show there are no new properties impacted by the regulatory 100-year floodplain limits and there is a minimal increase in WSE with property impacts similar to existing conditions for the lower storm events when analyzing the project using these conservative assumptions; therefore it is Hoyle Tanner's professional opinion the project will have minimal to no impact on the Tuttle Brook-Morris Creek floodplain for lower storm events and no impact on the regulatory 100-year floodplain. Because the project is located within a coastal flood hazard area, flood storage compensation is not required.

DETERMINATION

This document provides the determination from the Department of Homeland Security's Federal Emergency Management Agency (FEMA) regarding a request for a Letter of Map Revision (LOMR) for the area described above. Using the information submitted, we have determined that a revision to the flood hazards depicted in the Flood Insurance Study (FIS) report and/or National Flood Insurance Program (NFIP) map is warranted. This document revises the effective NFIP map, as indicated in the attached documentation. Please use the enclosed annotated map panel revised by this LOMR for floodplain management purposes and for all flood insurance policies and renewals in your community.

This determination is based on the flood data presently available. The enclosed documents provide additional information regarding this determination. If you have any questions about this document, please contact the FEMA Mapping and Insurance eXchange toll free at 18773362627 (1877FEMA MAP) or by letter addressed to the LOMC Clearinghouse, 3601 Eisenhower Avenue, Suite 500, Alexandria, VA 223046426. Additional Information about the NFIP is available on our website at https://www.fema.gov/floodinsurance.

DETERMINATION DOCUMENT (CONTINUED)

COMMUNITY INFORMATION

APPLICABLE NFIP REGULATIONS/COMMUNITY OBLIGATION

We have made this determination pursuant to Section 206 of the Flood Disaster Protection Act of 1973 (P.L. 93-234) and in accordance with the National Flood Insurance Act of 1968, as amended (Title XIII of the Housing and Urban Development Act of 1968, P.L. 90-448), 42 U.S.C. 4001-4128, and 44 CFR Part 65. Pursuant to Section 1361 of the National Flood Insurance Act of 1968, as amended, communities participating in the NFIP are required to adopt and enforce floodplain management regulations that meet or exceed NFIP criteria. These criteria, including adoption of the FIS report and FIRM, and the modifications made by this LOMR, are the minimum requirements for continued NFIP participation and do not supersede more stringent State/Commonwealth or local requirements to which the regulations apply.

We provide the floodway designation to your community as a tool to regulate floodplain development. Therefore, the floodway revision we have described in this letter, while acceptable to us, must also be acceptable to your community and adopted by appropriate community action, as specified in Paragraph 60.3(d) of the NFIP regulations.

NFIP regulations Subparagraph 60.3(b)(7) requires communities to ensure that the flood-carrying capacity within the altered or relocated portion of any watercourse is maintained. This provision is incorporated into your community's existing floodplain management ordinances; therefore, responsibility for maintenance of the altered or relocated watercourse, including any related appurtenances such as bridges, culverts, and other drainage structures, rests with your community. We may request that your community submit a description and schedule of maintenance activities necessary to ensure this requirement.

COMMUNITY REMINDERS

We based this determination on the 1-percent-annual-chance discharges and stillwater elevations computed in the FIS for your community. A comprehensive restudy of your community's flood hazards could establish greater flood hazards in this area.

Your community must regulate all proposed floodplain development and ensure that permits required by Federal and/or State/Commonwealth law have been obtained. State/Commonwealth or community officials, based on knowledge of local conditions and in the interest of safety, may set higher standards for construction or may limit development in floodplain areas. If your State/Commonwealth or community has adopted more restrictive or comprehensive floodplain management criteria, those criteria take precedence over the minimum NFIP requirements.

We will not print and distribute this LOMR to primary users, such as local insurance agents or mortgage lenders; instead, the community will serve as a repository for the new data. We encourage you to disseminate the information in this LOMR by preparing a news release for publication in your community's newspaper that describes the revision and explains how your community will provide the data and help interpret the NFIP maps. In that way, interested persons, such as property owners, insurance agents, and mortgage lenders, can benefit from the information.

This determination is based on the flood data presently available. The enclosed documents provide additional information regarding this determination. If you have any questions about this document, please contact the FEMA Mapping and Insurance eXchange toll free at 18773362627 (1877FEMA MAP) or by letter addressed to the LOMC Clearinghouse, 3601 Eisenhower Avenue, Suite 500, Alexandria, VA 223046426. Additional Information about the NFIP is available on our website at https://www.fema.gov/floodinsurance.

PUBLIC NOTIFICATION OF REVISION

A notice of changes will be published in the *Federal Register*. This information also will be published in your local newspaper on or about the dates listed below, and through FEMA's Flood Hazard Mapping website at https://www.floodmaps.fema.gov/fhm/bfe_status/bfe_main.asp

LOCAL NEWSPAPER

Name: *The New Haven Register*
Dates: September 5, 2024 and September 12, 2024

Within 90 days of the second publication in the local newspaper, any interested party may request that we reconsider this determination. Any request for reconsideration must be based on scientific or technical data. Therefore, this letter will be effective only after the 90day appeal period has elapsed and we have resolved any appeals that we receive during this appeal period. Until this LOMR is effective, the revised flood hazard determination presented in this LOMR may be changed.

This determination is based on the flood data presently available. The enclosed documents provide additional information regarding this determination. If you have any questions about this document, please contact the FEMA Mapping and Insurance eXchange toll free at 1-877-336-2627 (1-877-FEMA MAP) or by letter addressed to the LOMC Clearinghouse, 3601 Eisenhower Avenue, Suite 500, Alexandria, VA 22304-6426. Additional Information about the NFIP is available on our website at https://www.fema.gov/flood-insurance.

MAP REVISED
JULY 8, 2013

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) Report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS Report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations table in the Flood Insurance Study Report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study Report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study Report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was Connecticut State Plane Zone (FIPS zone 0600). The **horizontal datum** was NAD 83, GRS 1980 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum.** For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

NGS Information Services
NOAA, N/NGS12
National Geodetic Survey
SSMC-3, #9202
1315 East-West Highway
Silver Spring, Maryland 20910-3282
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713- 3242**, or visit its website at http://www.ngs.noaa.gov.

Base map information shown on FIRM panels produced for this coastal study revision was derived from United State Geological Survey 2008 High Resolution Orthophotography produced from 1 foot pixel cells from photography dated April 2008. The projection used in the preparation of this map was Connecticut State Plane Feet, FIPS Zone 0600. The horizontal datum used was North American Datum of 1983 (NAD 83).

The AE Zone category has been divided by a **Limit of Moderate Wave Action (LiMWA)**.The LiMWA represents the approximate landward limit of the 1.5 foot breaking wave.The effects of wave hazards between the VE Zone and the LiMWA (or between the shoreline and the LiMWA for areaswhere VE Zones are not identified) will be similar to, but less severe than those in the VE Zone.

The **profile baselines** depicted on this map represent the hydraulic modeling baselines that match the flood profiles in the FIS report. As a result of improved topographic data, the **profile baseline**, in some cases, may deviate significantly from the channel centerline or appear outside the SFHA.

Based on updated topographic information, this map reflects more detailed and up-to-date **stream channel configurations and floodplain delineations** than those shown on the previous FIRM for this jurisdiction. As a result, the Flood Profiles and Floodway Data tables for multiple streams in the Flood Insurance Study Report (which contains authoritative hydraulic data) may reflect stream channel distances that differ from what is shown on the map. Also, the road to floodplain relationships for unrevised streams may differ from what is shown on previous maps.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

For information on available products associated with this FIRM visit the **Map Service Center (MSC)** website at http://msc.fema.gov. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. Many of these products can be ordered or obtained directly from the MSC website.

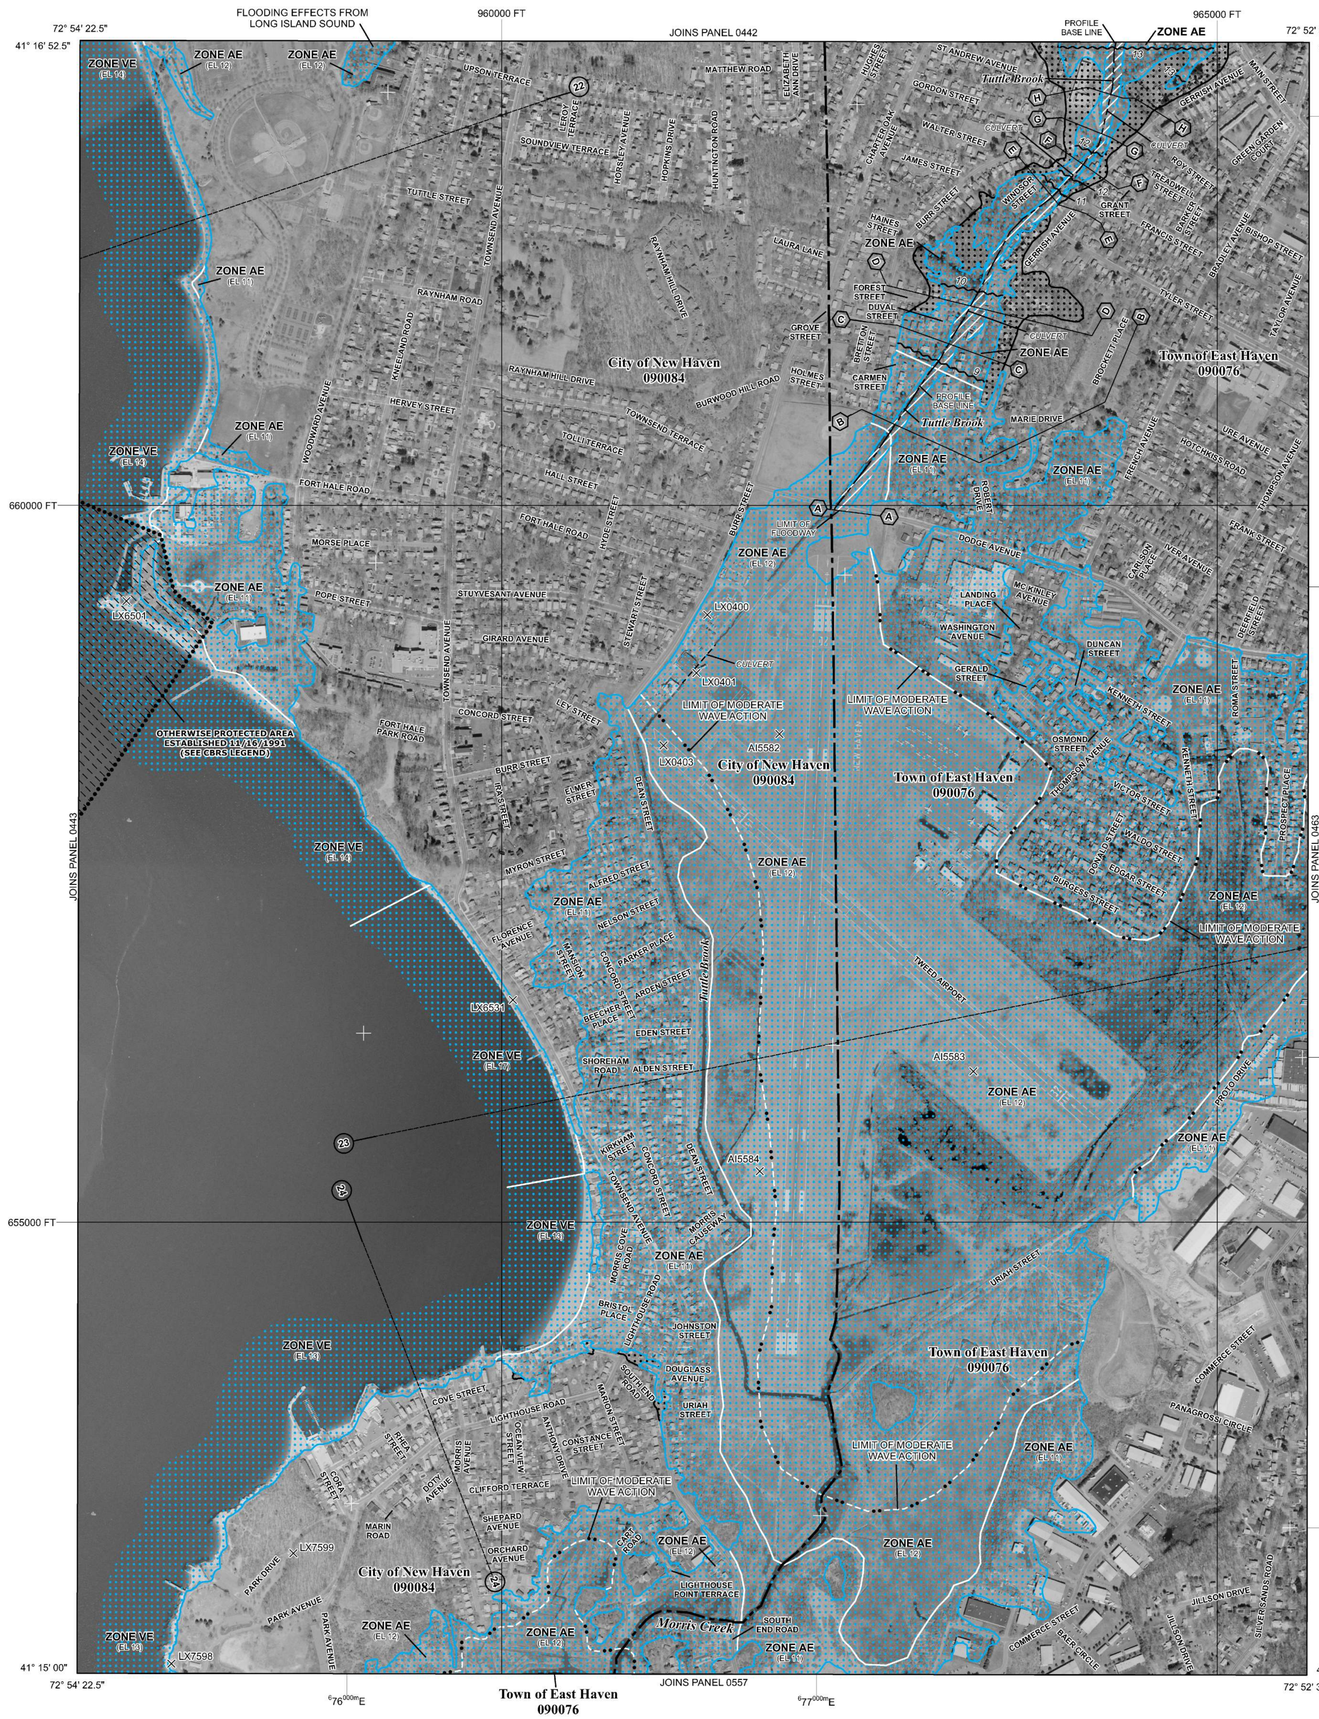
If you have **questions about this map,** how to order products, or the National Flood Insurance Program in general, please call the **FEMA Map Information eXchange (FMIX)** at **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) LEGEND

11-16-1991 Otherwise Protected Area (OPA)
FLOOD INSURANCE NOT AVAILABLE FOR STRUCTURES NEWLY BUILT OR SUBSTANTIALLY IMPROVED ON OR AFTER NOVEMBER 16, 1991 IN DESIGNATED OPAs WITHIN THE CBRS.

Boundaries of the John H. Chafee Coastal Barrier Resources System (CBRS) shown on this FIRM were transferred from the official CBRS source map(s) for this area and are depicted on this FIRM for informational purposes only. The official CBRS maps are enacted by Congress via the Coastal Barrier Resources Act, as amended, and maintained by the U.S. Fish and Wildlife Service (FWS). The official CBRS maps used to determine whether or not an area is located within the CBRS are available for download at http://www.fws.gov. For an official determination of whether or not an area is located within the CBRS, or for any questions regarding the CBRS, please contact the FWS field office for this area at 603-223-2541.

Only coastal structures that are certified to provide protection from the 1 percent annual chance flood are shown on this panel. However, all structures taken into consideration for the purpose of coastal flood hazard analysis and mapping are present in the FIRM database in S_Gen_Struct.



LEGEND

SPECIAL FLOOD HAZARD AREAS (SFHAs) SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Special Flood Hazard Areas formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
ZONE A99	Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

- 1% Annual Chance Floodplain Boundary
- 0.2% Annual Chance Floodplain Boundary
- Floodway boundary
- Zone D boundary
- CBRS and OPA boundary
- Boundary dividing Special Flood Hazard Area Zones and boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths, or flood velocities.
- Limit of Moderate Wave Action
- Limit of Moderate Wave Action coincident with Zone Break
- 513 — Base Flood Elevation line and value; elevation in feet*
- (EL 987) — Base Flood Elevation value where uniform within zone; elevation in feet*

*Referenced to the North American Vertical Datum of 1988

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was Connecticut State Plane (FIPSZONE 0600). The **horizontal datum** was NAD83, GRS1980 spheroid. Differences in datum, spheroid, projection or State Plane zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of the FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum.** For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov/ or contact the National Geodetic Survey at the following address:

NGS Information Services
NOAA, N/NGS12
National Geodetic Survey
SSMC-3, #9202
1315 East-West Highway
Silver Spring, MD 20910-3282

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242,** or visit its website at http://www.ngs.noaa.gov/.

Base map information shown on this FIRM was provided in digital format by the Connecticut Department of Environmental Protection. This information was derived from digital orthophotos produced at a scale of 1:12,000 from aerial photography flown in 2004 supplemented with aerial photography from 2000.

This map reflects more detailed and up-to-date **stream channel configurations** than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables *in the Flood Insurance Study report (which contains authoritative hydraulic data)* may reflect stream channel distances that differ from what is shown on this map.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

Contact the **FEMA Map Service Center** at 1-800-358-9616 for information on available products associated with this FIRM. Available products may include previously issued Letters of Map Change, *a Flood Insurance Study report,* and/or digital versions of this map. The FEMA Map Service Center may also be reached by Fax at 1-800-358-9620 and its website at http://www.msc.fema.gov/.

If you have **questions about this map** or questions concerning the National Flood Insurance Program in general, please call **1-877-FEMA MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/.

MEMO

To: Robert Furey and Jenae Carraway, Hoyle Tanner
From: Thomas P. Ballestero, Streamworks
Subject: WHAFIS Analysis of Tweed New Haven Airport Expansion
Date: 17 December 2024

Introduction

The planned expansion of the Tweed New Haven Airport in New Haven, CT includes expanding a runway and terminal construction. These concepts include fill in coastal areas presently inundated by extreme water levels. As a result, the effect of the proposed expansion on coastal flooding due to wave action was requested to be analyzed. This memo explains the methodology for the wave height analysis, the scenarios modeled, and the results.

Wave Height Analysis

Wind-generated waves are created when wind blows over open distances (fetch) of water. Energy from the wind is transferred to the water via the shear stress between the two fluids (air and water). In deep water settings, the wave height is limited by either the strength of the wind, the length of the fetch, or the duration of the wind. In shallow water areas, in addition to wave height limitations of deep water, waves are limited by the water depth and friction on the bottom, vegetation, or infrastructure.

The methods to generate wave heights from wind were described in the Shore Protection Manual (USACOE, 1964) and subsequently packaged in 1980 into a program called WHAFIS – wave height analysis for flood insurance studies. WHAFIS was developed to, "…*predict wave heights associated with hurricane coastal storm surge*." Waves may come in from offshore and grow or decay, or waves may be generated on inland fetches. In WHAFIS, when waves reach a location where the land surface exceeds the still water level, the wave height is set to to zero.

A note must be mentioned about the wave height. Waves of all sizes are created by the wind, and therefore the waves moving shoreward have a probability distribution describing the wave heights and their frequencies (probabilities). The wave height developed within WHAFIS is the "zero-moment wave height", which represents the zero frequency

moment of the wave energy spectral density. The zero moment wave height can be related to the root mean square wave height or any other wave height through the use of the commonly used Rayleigh distribution that describes wave height. Some notable wave heights of interest when looking at extremes are: the significant wave height (which is the average height of the largest 1/3 of all waves); and for flood insurance studies the controlling wave height (which is the average wave height of the largest 1% of all waves). In deep water, the zero moment wave height is the significant wave height, but in shallower water, the significant wave height is greater than the zero moment wave height.

Waves break when (approximately) the wave height is greater than 0.78 times the water depth. Thus, as inland water depth decreases, the WHAFIS predicted wave heights will also decrease.

The total water surface elevation from WHAFIS is the Stillwater elevation plus that portion of the wave crest above the still water level. Since in shallow waters waves are not symmetric about the still water level, the fraction of the wave height above the still water level is 0.7 times the wave height (although in reality this value varies between 0.5 and 1.0 due to site specific conditions).

WHAFIS does not compute wave set up. Set up is included in the still water elevation. For flood insurance studies, the still water elevation includes high tide, surge, and wave set-up.

WHAFIS uses a constant wind speed of 60 miles per hour for the Connecticut coastline.

The WHAFIS model (version 4.0, August, 2007) was run inside a shell program, the Coastal Hazard Analysis Modeling Program - CHAMP (version 2.0 April, 2007). CHAMP is a Windows interface program that organizes input data into an ACCESS database, runs various coastal programs, organizes program output, all with graphical interface.

Existing WHAFIS model (Duplicate Effective Model)

The input files for the existing Tweed New Haven Airport transect (Transect 23 in the Long Island FIS) were made available by the FEMA Engineering Library Team. The file information was for the Long Island Sound Coastal data from study 10-01-0665S with CHAMP, nearshore, offshore and still water modeling; wind & wave; production runs and spatial files.

WHAFIS Model Boundary Conditions

The boundary condition (open water) wave information of the existing FIS model was kept the same for all model simulations. These conditions included:

- 1% Still water elevation of 10.546 feet NAVD 88
- Initial wave height = 13.2 feet
- Initial wave period = 5.39 seconds

It should be noted that because the land elevation soon after the shoreline rises to well above the still water elevation (for all simulations), this open water wave is not transmitted to the inland salt marsh at the Tweed New Haven Airport.

WHAFIS Simulations

Three WHAFIS simulations were conducted (*plot identifiers follow each*):

- The existing conditions of the 2011 FIS: *Original FIS* (Duplicate Effective Model)
- The updated topography/bathymetry that included 2016 CT LiDAR and 2024 survey information in the vicinity of the airport: *2024 Topography* (Corrected Effective and Pre-Project Model)
- The updated topography/bathymetry with the proposed Tweed New Haven Airport modifications. *Proposed Airport Modifications*. Note: runway modifications are from horizontal location 2239 to 3039 and terminal modifications are from horizontal location 3039 to 3254. (Post-Project Model)

A graph of the Duplicate Effective 2011 FIS topography/bathymetry compared to Corrected Effective/Pre-Project Model (2016 CT LiDAR and 2024 airport data) may be found in Figure 1. A close-up of the Figure 1 plot in the vicinity of the airport may be found in Figure 2. The proposed airport modifications Post-Project are compared to the Corrected Effective/Pre-Project Model 2024 topographic data to create Figure 3.

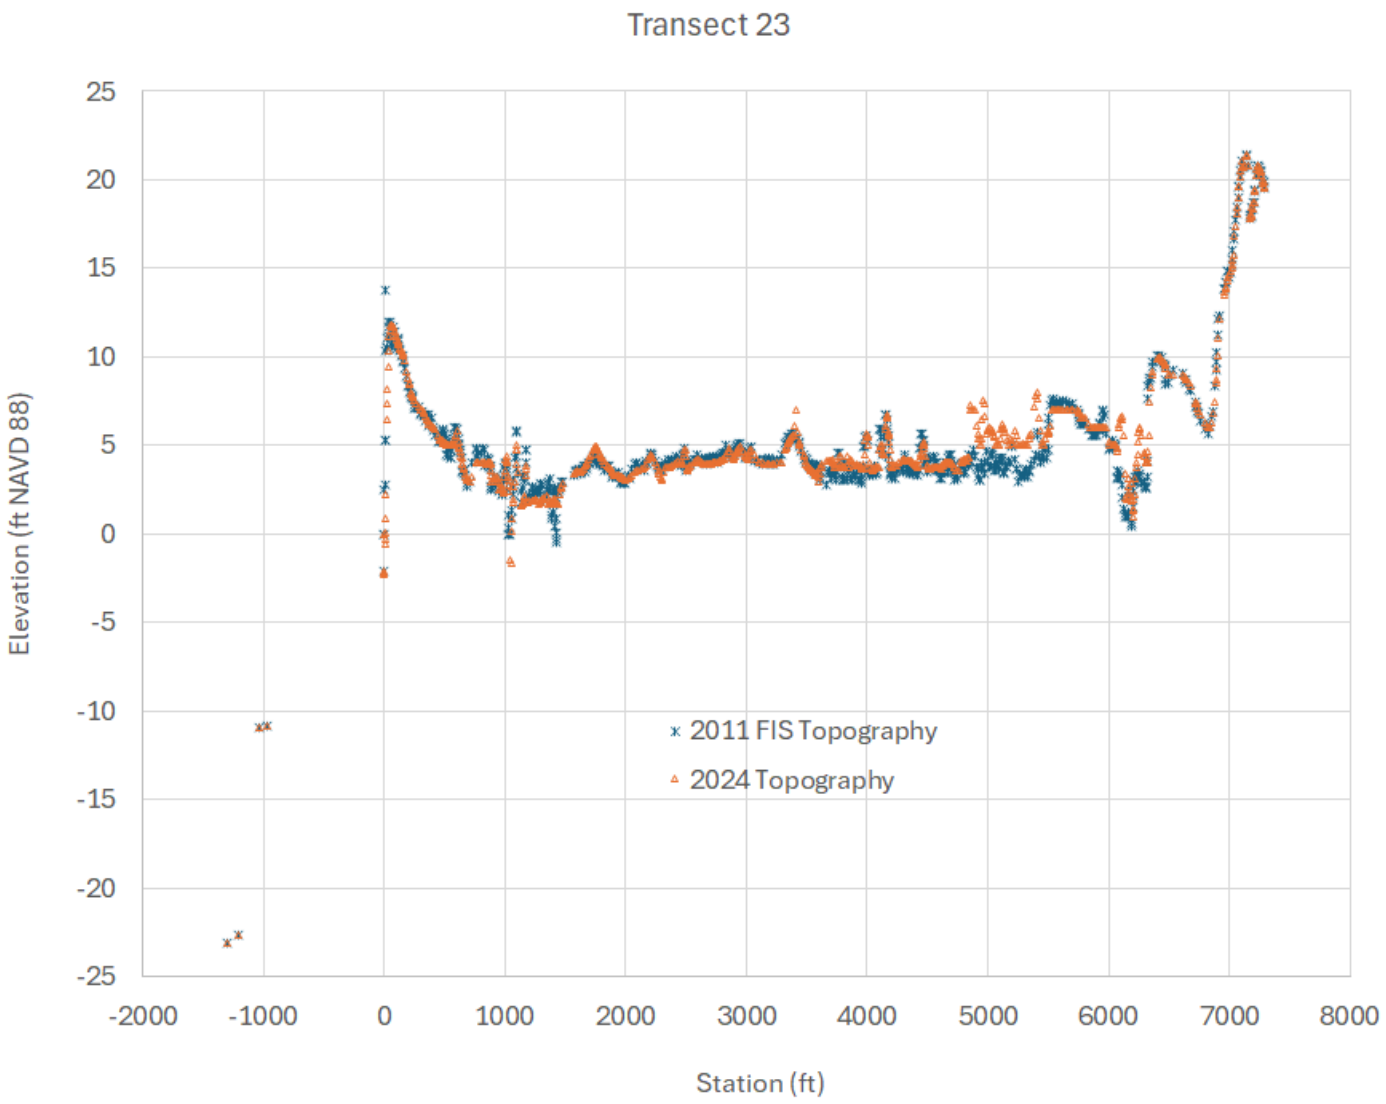

Figure 1. Comparison between Duplicate Effective 2011 FIS topography to Corrected Effective/Pre-Project Model 2024 topography

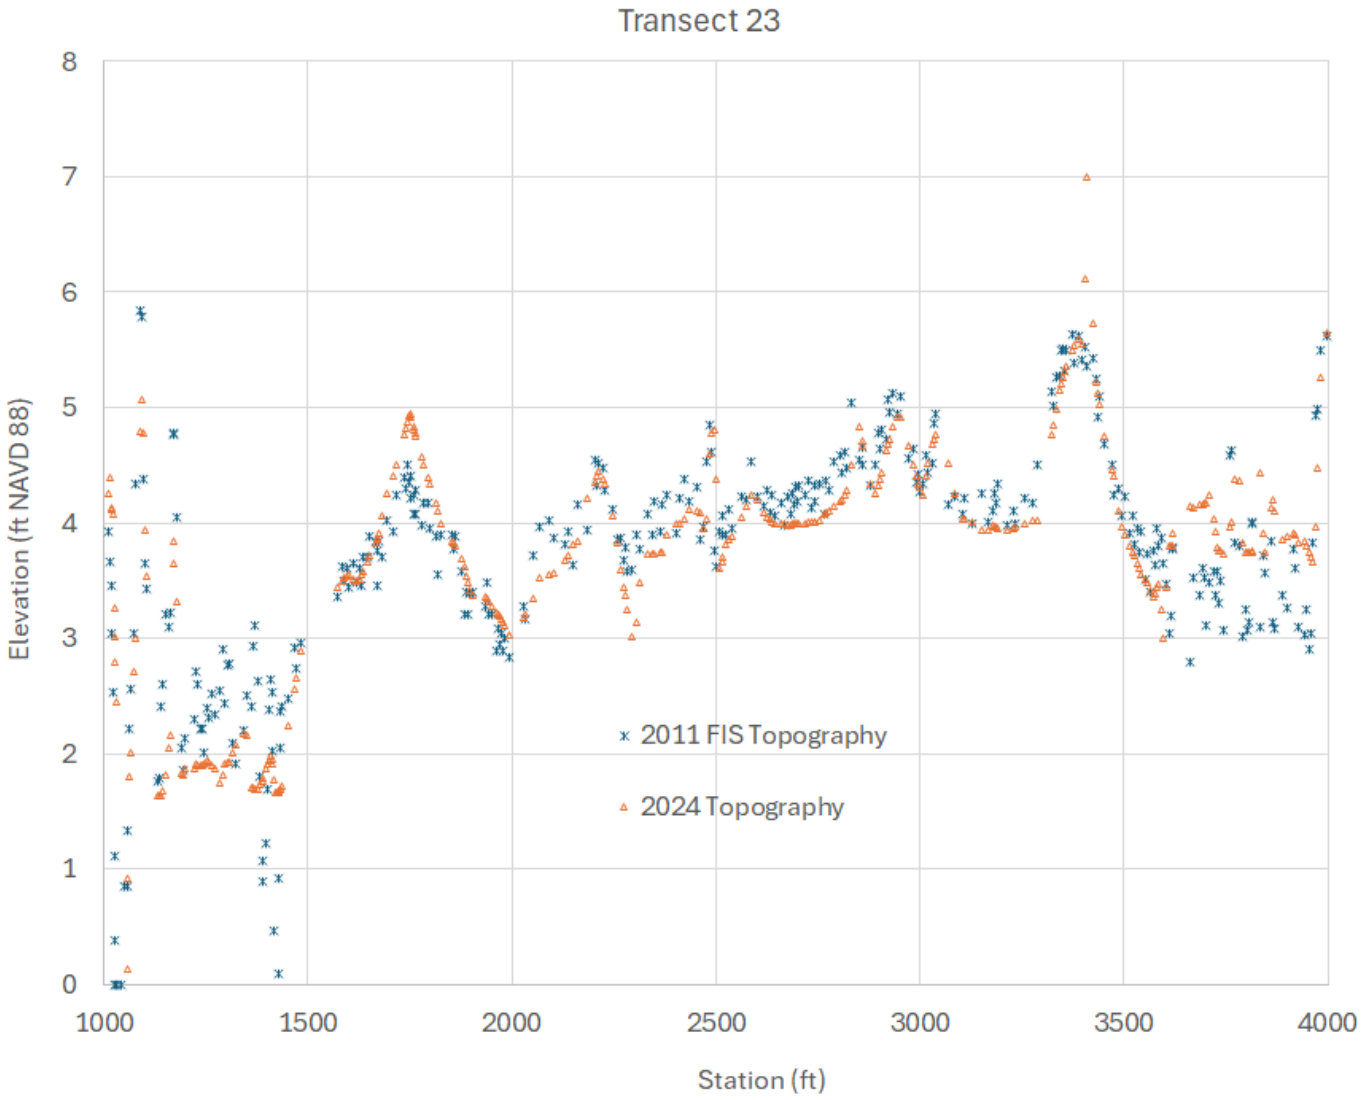

Figure 2. Comparison between Duplicate Effective 2011 FIS topography to Corrected Effective/Pre-Project Model 2024 topography in the vicinity of Tweed Airport

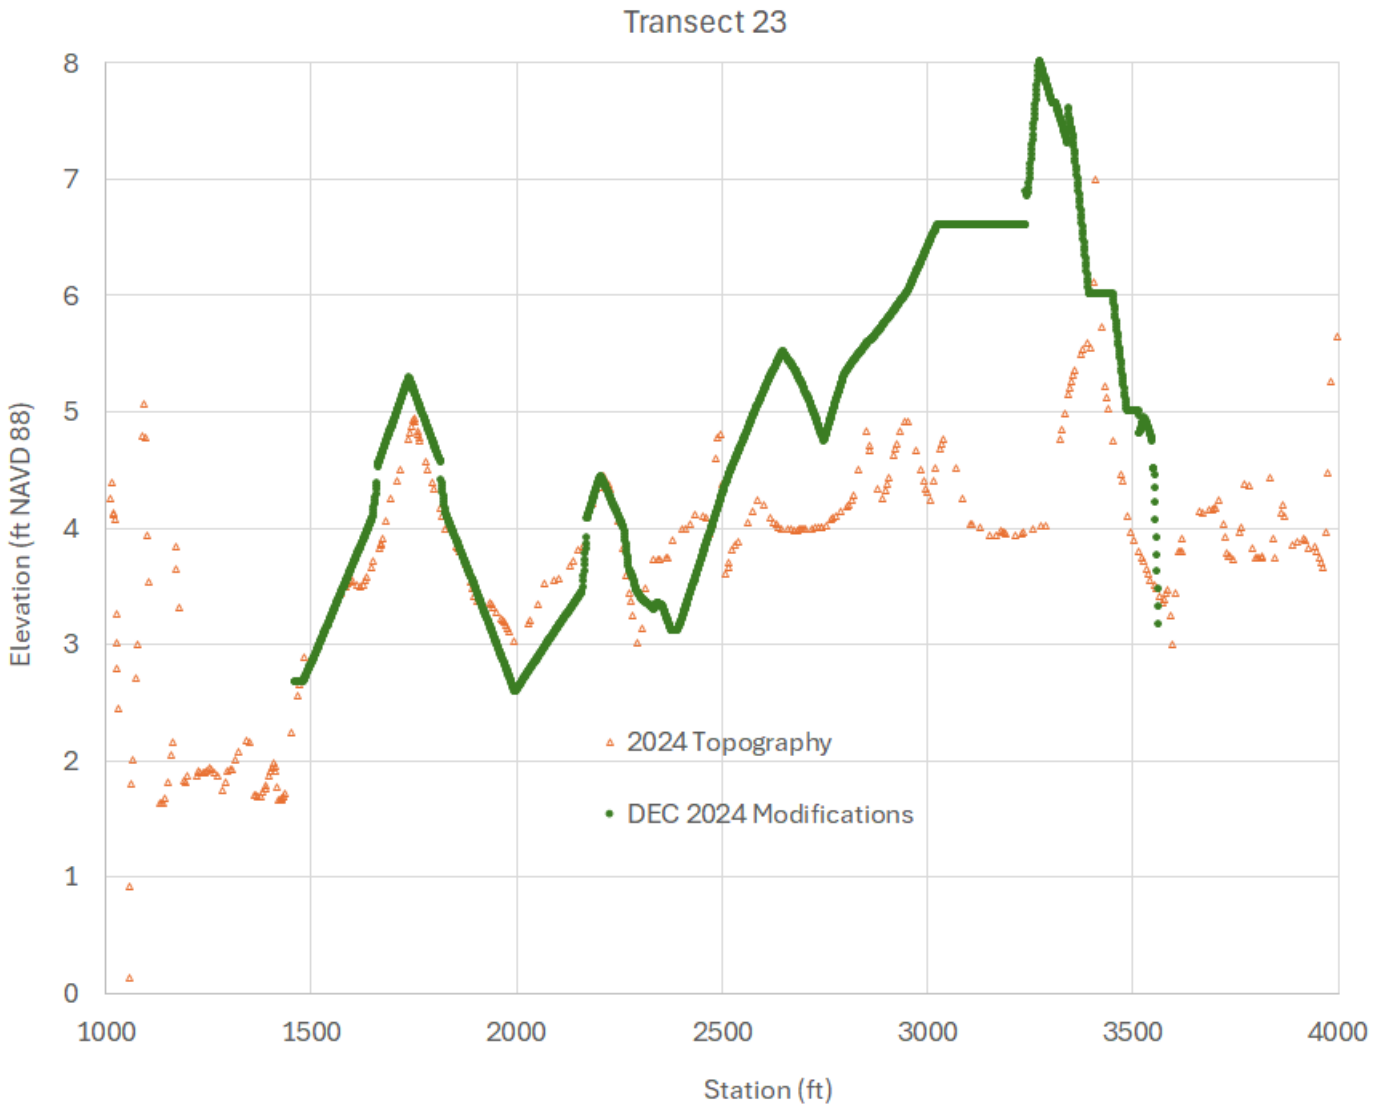

Figure 3. Comparison between Corrected Effective/Pre-Project Model 2024 topography to Post-Project 2024 topography with airport modifications

WHAFIS Model Results

There were some small differences in flood characterization between the Duplicate Effective Model from the FIS and the Corrected Effective/Pre-Project topography/bathymetry of today (2024) as seen in Tables 1 and 2.

Table 1. Duplicate Effective FIS Flood Hazard Factors (FHF) and Designations

Station (ft)	Elevation (ft NAVD 88)	Topography Zone	Topography Designation	FHF

		A22	EL=11	120
6867	10.55			

The more detailed WHAFIS results between the Duplicate Effective Model and the Corrected Effective/Pre-Project Model topography of today may be seen in Figure 3.

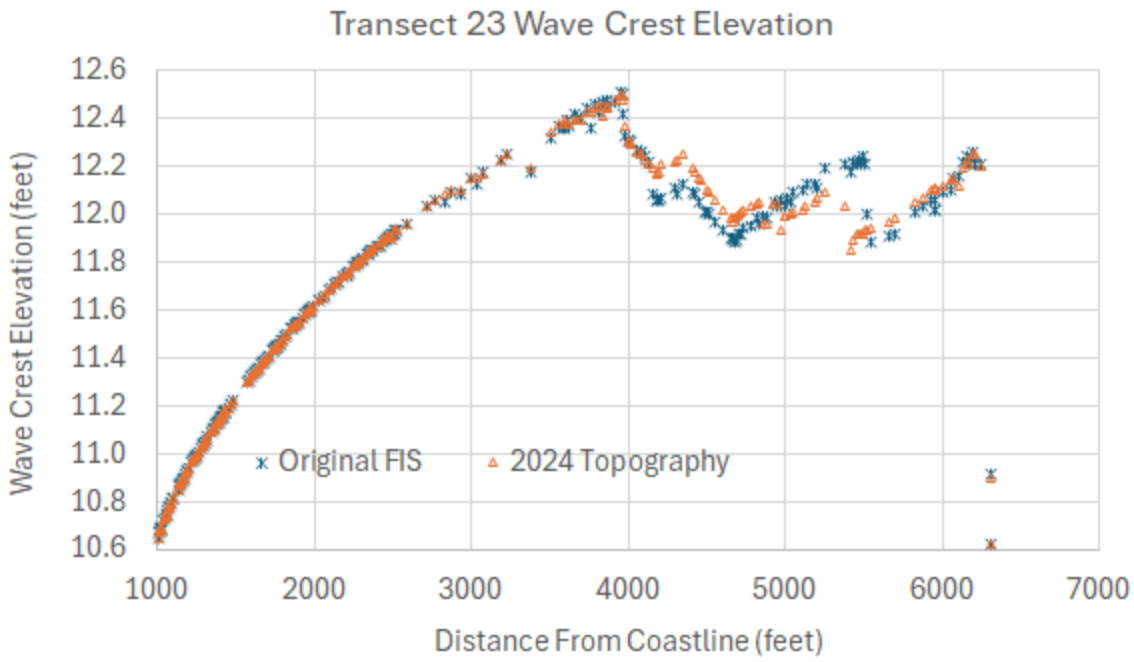

Figure 3. WHAFIS Elevation Comparisons between Duplicate Effective Model and Corrected Effective/Pre-Project Model

WHAFIS Modeling Note: The terminal building itself is planned to be above the Base Flood Elevation. It is supported by piles. To model the pile system in WHAFIS, two methods were employed: as Buildings (BU Cards) and as permanent vegetation (VE Cards). The VE method resulted with higher wave crest elevations than the Building method, and therefore the VE results are presented herein.

Comparison of the wave crest elevations at the location of the runway modifications and terminal modifications may be seen in Figure 4 and Table 3. The runway modifications do not significantly affect the wave crest elevations until about station 2800, where significant decreases in wave crest elevations are exhibited. There is a more significant drop in the wave crest elevation at the proposed terminal (station 3039 to 3254) which then results in significantly lower wave crest elevations landward. The WHAFIS results from which Figures 3, 4, and 5 were developed may be found in the Appendices.

The WHAFIS output information (output file, Part 1 file, Part 2 file, Part 3 File, and Part 6 file) for each of the modeled scenarios may be found in Appendices 1, 2, and 3.

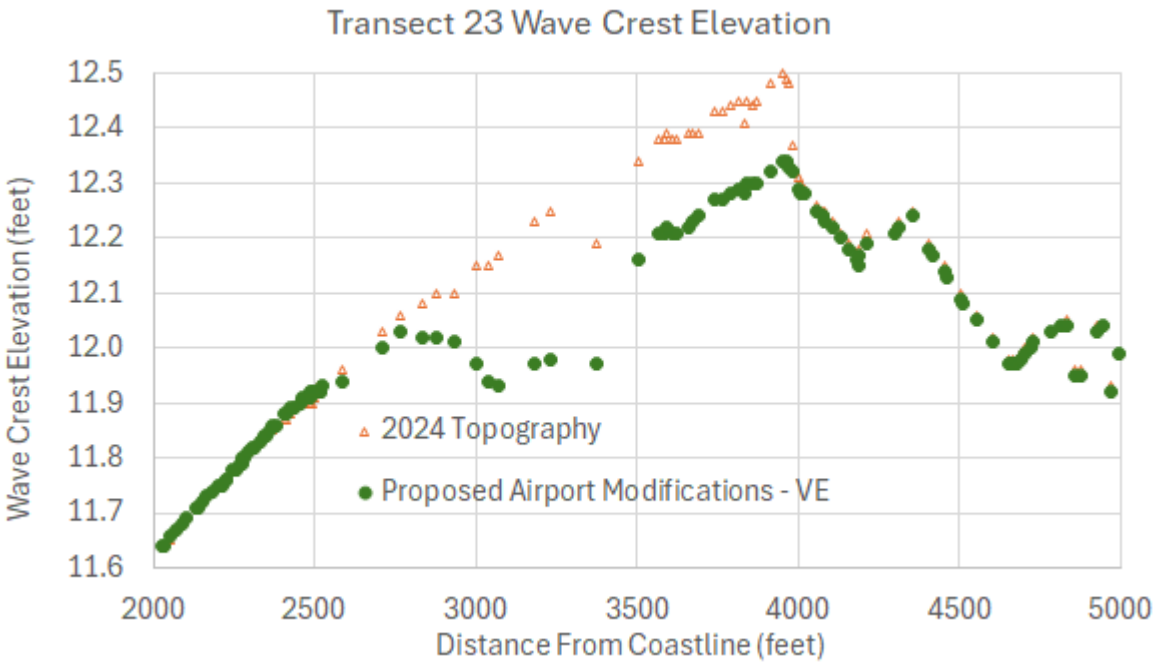

Figure 4. WHAFIS Elevation Comparisons between Corrected Effective/Pre-Project Model and Post-Project Model

Table 3. Post-Project 2024 Topography Flood Hazard Factors (FHF) and Designations With Airport Modifications

Station (ft)	Elevation (ft NAVD 88)	Topography Zone	Topography Designation	FHF
121	10.55			
		A22	EL=11	120
1832	11.5			
		A22	EL=12	120
6285	11.5			
		A22	EL=11	120
6867	10.55			

Conclusion

As witnessed by the comparison of Tables 2 and 3, the proposed Tweed Airport modifications do not change flood hazards due to wind-generated waves.

Appendix 1

WHAFIS Results for Existing FIS (2011)

Duplicate Effective Model

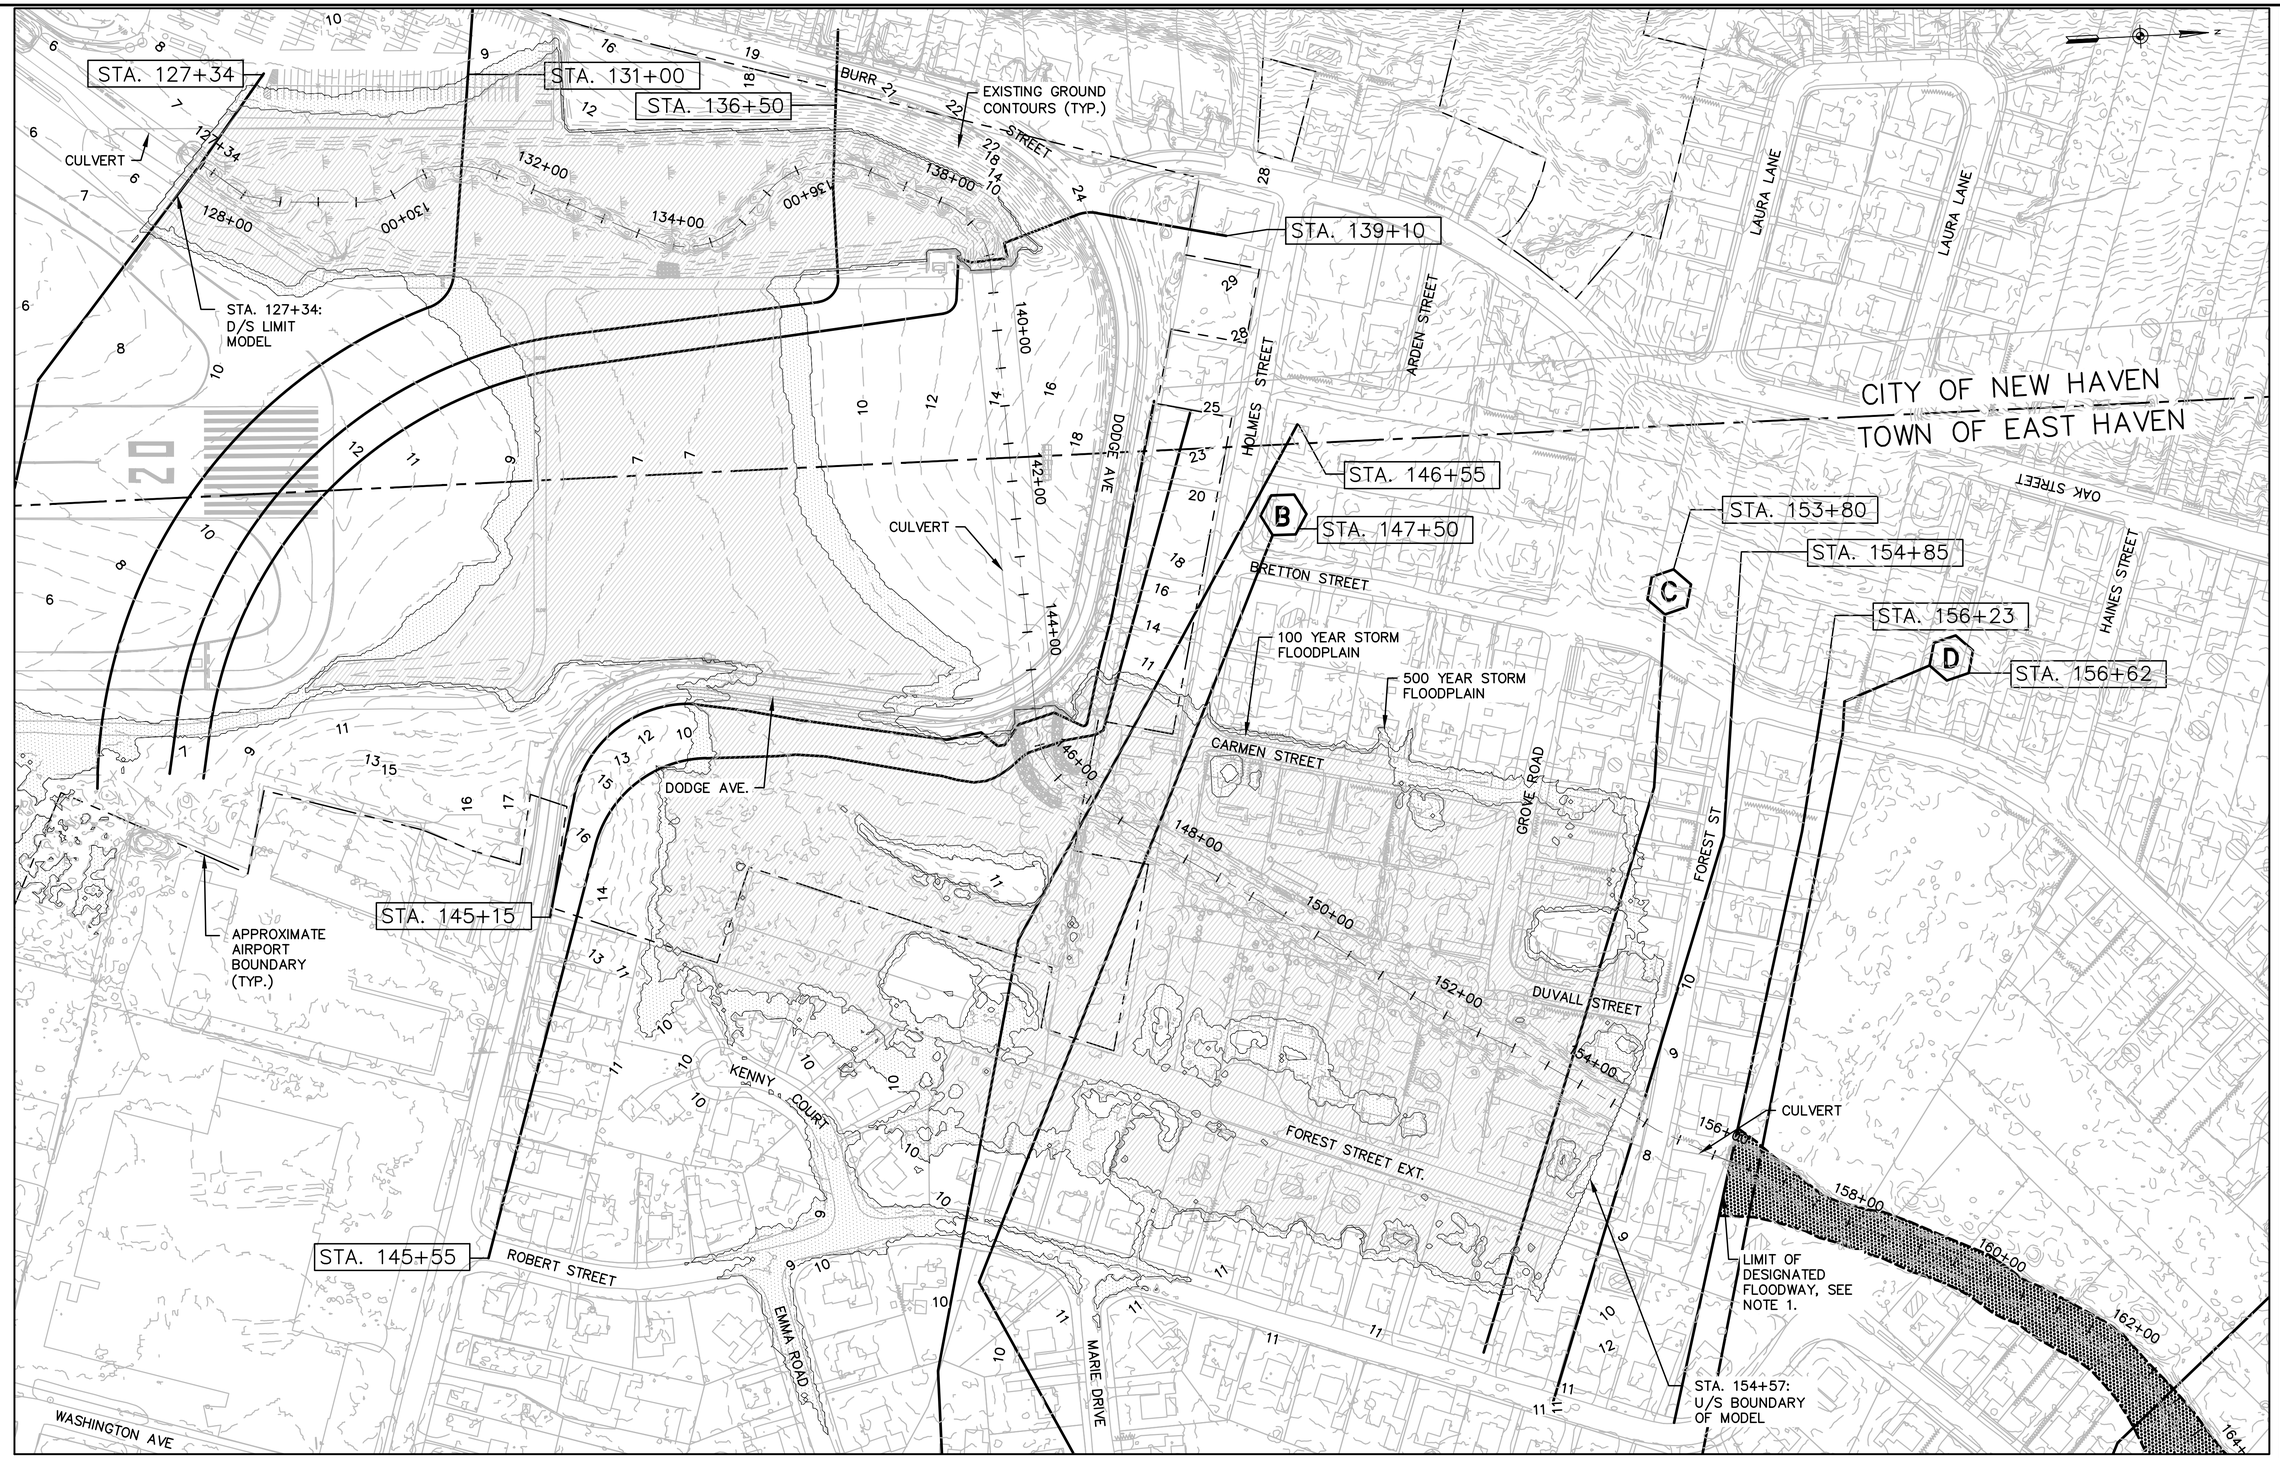
Appendix D: FEMA Riverine Model Cross Section and Inundation Maps

- Existing FEMA Map (FE-1)
- Proposed FEMA Map (FE-2)
- 100-Year Pre- vs. Post-Project Comparison FEMA Map (FE-3)
- 500-Year Pre- vs. Post-Project Comparison FEMA Map (FE-4)



LEGEND:

- 1% ANNUAL CHANCE FLOODPLAIN BOUNDARY
- 0.2% ANNUAL CHANCE FLOODPLAIN BOUNDARY
- FLOODWAY BOUNDARY
- STA. 153+80 — FEMA CROSS SECTION
- STA. 146+55 — 2012 LOMR CROSS SECTION

NOTES
1. FLOODWAY BOUNDARY REFLECTS THE BOUNDARY DEPICTED IN THE LOMR(EFFECTIVE 2012) AND THE LOMR (EFFECTIVE 2025)
2. FLOODPLAIN BOUNDARIES REFLECT THE HOYLE TANNER HEC-RAS 2D RIVERINE MODEL RESULTS ONLY AND DO NOT REFLECT THE CURRENTLY EFFECTIVE OR ANY PENDING FLOODPLAIN BOUNDARIES.
3. ELEVATIONS ARE BASED ON NAVD 88
4. PARCELS FROM CT GIS

Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: State of Connecticut, Western Part
Survey Area Data: Version 1, Sep 15, 2023

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Jun 14, 2022—Oct 6, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
5	Wilbraham silt loam, 0 to 3 percent slopes	C/D	1.0	0.0%
6	Wilbraham and Menlo soils, 0 to 8 percent slopes, extremely stony	C/D	2.0	0.0%

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Rating Options

Aggregation Method: Dominant Condition

Component Percent Cutoff: None Specified

Tie-break Rule: Higher

Basin Characteristics

Parameter Code	Parameter Description	Value	Unit
CRSDFT	Percentage of area of coarse-grained stratified drift	1.76	percent
DRNAREA	Area that drains to a point on a stream	0.82	square miles
ELEV	Mean Basin Elevation	25.7	feet
I24H100Y	Maximum 24-hour precipitation that occurs on average once in 100 years	8.07	inches
I24H10Y	Maximum 24-hour precipitation that occurs on average once in 10 years	5.15	inches
I24H200Y	Maximum 24-hour precipitation that occurs on average once in 200 years	9.32	inches
I24H25Y	Maximum 24-hour precipitation that occurs on average once in 25 years	6.32	inches
I24H2Y	Maximum 24-hour precipitation that occurs on average once in 2 years - Equivalent to precipitation intensity index	3.12	inches
I24H500Y	Maximum 24-hour precipitation that occurs on average once in 500 years	10.96	inches
I24H50Y	Maximum 24-hour precipitation that occurs on average once in 50 years	7.19	inches
I24H5Y	Maximum 24-hour precipitation that occurs on average once in 5 years	4.28	inches
NOVAVPRE	Mean November Precipitation	4.1	inches
PRCWINTER	Mean annual precipitation for December through February	3.7	inches
SSURGOCCDD	Percentage of area with hydrologic soil types C, D, or C/D from SSURGO	0.2295	percent
WETLAND	Percentage of Wetlands	4.98	percent

General Disclaimers

This watershed has been edited, computed flows and basin characteristics may not apply. For more information, submit a support request from the 'Help' button in the upper-right of the screen, attach a pdf of this report and request assistance from your local StreamStats regional representative.

Basin Characteristics

Parameter Code	Parameter Description	Value	Unit
CRSDFT	Percentage of area of coarse-grained stratified drift	2.7	percent
DRNAREA	Area that drains to a point on a stream	2.91	square miles
ELEV	Mean Basin Elevation	60.1	feet
I24H100Y	Maximum 24-hour precipitation that occurs on average once in 100 years	8.13	inches
I24H10Y	Maximum 24-hour precipitation that occurs on average once in 10 years	5.18	inches
I24H200Y	Maximum 24-hour precipitation that occurs on average once in 200 years	9.38	inches
I24H25Y	Maximum 24-hour precipitation that occurs on average once in 25 years	6.35	inches
I24H2Y	Maximum 24-hour precipitation that occurs on average once in 2 years - Equivalent to precipitation intensity index	3.13	inches

Parameter Code	Parameter Description	Value	Unit
I24H500Y	Maximum 24-hour precipitation that occurs on average once in 500 years	11.05	inches
I24H50Y	Maximum 24-hour precipitation that occurs on average once in 50 years	7.24	inches
I24H5Y	Maximum 24-hour precipitation that occurs on average once in 5 years	4.3	inches
NOVAVPRE	Mean November Precipitation	4.1	inches
PRCWINTER	Mean annual precipitation for December through February	3.7	inches
SSURGOCCDD	Percentage of area with hydrologic soil types C, D, or C/D from SSURGO	0.4499	percent
WETLAND	Percentage of Wetlands	1.25	percent

General Disclaimers

This watershed has been edited, computed flows and basin characteristics may not apply. For more information, submit a support request from the 'Help' button in the upper-right of the screen, attach a pdf of this report and request assistance from your local StreamStats regional representative.

Peak-Flow Statistics

Peak-Flow Statistics Parameters [Statewide DA only SIR 2020 5054]

Parameter Code	Parameter Name	Value	Units	Min Limit	Max Limit
DRNAREA	Drainage Area	2.91	square miles	0.69	325

Peak-Flow Statistics Parameters [Statewide Multiparameter SIR 2020 5054]

Parameter Code	Parameter Name	Value	Units	Min Limit	Max Limit
DRNAREA	Drainage Area	2.91	square miles	0.69	325
I24H2Y	24 Hour 2 Year Precipitation	3.13	inches	2.77	3.32
SSURGOCCDD	Percent soil type C or D from SSURGO	0.4499	percent	0.118	0.945
I24H5Y	24 Hour 5 Year Precipitation	4.3	inches	4	4.7
I24H10Y	24 Hour 10 Year Precipitation	5.18	inches	4.86	5.79

Summary Tables for the 2-, 10-, 25-, and 50-year Inundation Results from the CTDEEP Riverine 2D HEC-RAS Model. Only impacts outside of airport property are noted.

NAVD88	2 Year Storm Event			Notes
River Station	Max Pre-Project WSE (ft, NAVD88)	Max Post-Project WSE (ft, NAVD88)	Change in WSE (ft, NAVD88)	
153+80 (C)	7.73	7.72	0.0	
147+50 (B)	7.16	7.15	-0.1	
127+35	6.67	6.65	-0.1	
112+80	5.35	5.34	0.1	Encroachment limits similar to existing conditions for existing structures of nearby suburbs but no change to FEMA 100-year regulatory limits.
111+85	5.29	5.30	0.0	Localized increase in Alfred St-Nelson St neighborhood. Potential for increased encroachment of existing structures per CT GIS and aerial imagery but no change to FEMA 100-year regulatory limits.
97+00	4.87	4.94	0.0	Encroachment limits similar to existing conditions for existing structures but no change to FEMA 100-year regulatory limits.
78+75	4.86	4.93	0.0	Localized WSE increase in the area of Kirkham St-Concord St-Townsend Avenue. Potential for increased encroachment of existing structures per CT GIS and aerial imagery but no change to FEMA 100-year regulatory limits.
76+75	4.86	4.93	0.0	Encroachment limits similar to existing conditions for existing structures but no change to FEMA 100-year regulatory limits.
68+60	4.86	4.91	0.0	Encroachment limits similar to existing conditions for existing structures but no change to FEMA 100-year regulatory limits.
61+50	4.84	4.90	0.1	WSE increase in existing wetland area. No encroachment of existing structures per CT GIS or aerial imagery. No change to FEMA 100-year regulatory limits.
55+65	4.84	4.89	0.1	WSE increase in existing wetland area. No encroachment of existing structures per CT GIS or aerial imagery. No change to FEMA 100-year regulatory limits.
45+45	4.84	4.88	0.1	WSE increase contained within airport property. No change to FEMA 100-year regulatory limits.
43+65	4.72	4.77	0.1	WSE increase near Morris Creek. Encroachment limits similar to existing conditions for existing structures but no change to FEMA 100-year regulatory limits.

NAVD88	10 Year Storm Event			Notes
River Station	Max Pre-Project WSE (ft, NAVD88)	Max Post-Project WSE (ft, NAVD88)	Change in WSE (ft, NAVD88)	
153+80 (C)	8.54	8.53	0.0	
147+50 (B)	7.97	7.96	0.0	
127+35	7.11	7.08	0.0	
112+80	5.69	5.81	0.1	Encroachment limits similar to existing conditions for existing structures of nearby suburbs but no change to FEMA 100-year regulatory limits.
111+85	5.69	5.81	0.1	WSE increase in existing wetland/forested area. No encroachment of existing structures per CT GIS or aerial imagery. No change to FEMA 100-year regulatory limits.
97+00	5.65	5.77	0.1	Encroachment limits similar to existing conditions for existing structures but no change to FEMA 100-year regulatory limits.
78+75	5.65	5.75	0.0	Localized WSE increase in existing wetland area. Encroachment limits similar to existing conditions for existing structures but no change to FEMA 100-year regulatory limits.
76+75	5.65	5.74	0.0	Localized WSE increase in existing wetland area. Encroachment limits similar to existing conditions for existing structures but no change to FEMA 100-year regulatory limits.
68+60	5.65	5.74	0.0	Localized WSE increase in existing wetland area. Encroachment limits similar to existing conditions for existing structures but no change to FEMA 100-year regulatory limits.
61+50	5.65	5.74	0.1	Localized WSE increase in existing wetland area. Encroachment limits similar to existing conditions for existing structures but no change to FEMA 100-year regulatory limits.
55+65	5.65	5.74	0.1	WSE increase in existing wetland/forested area. No encroachment of existing structures per CT GIS or aerial imagery. No change to FEMA 100-year regulatory limits.
45+45	5.64	5.73	0.1	WSE increase in existing wetland/forested area. No encroachment of existing structures per CT GIS or aerial imagery. No change to FEMA 100-year regulatory limits.
43+65	5.55	5.64	0.1	WSE increase near Morris Creek. Encroachment limits similar to existing conditions for existing structures but no change to FEMA 100-year regulatory limits.

NAVD88	25 Year Storm Event			Notes
River Station	Max Pre-Project WSE (ft, NAVD88)	Max Post-Project WSE (ft, NAVD88)	Change in WSE (ft, NAVD88)	
153+80 (C)	8.90	8.89	0.0	
147+50 (B)	8.38	8.36	0.0	
127+35	7.30	7.27	0.0	
112+80	6.10	6.15	0.1	Encroachment limits similar to existing conditions for existing structures of nearby suburbs but no change to FEMA 100-year regulatory limits.
111+85	6.05	6.15	0.1	WSE increase in existing wetland/forested area. No encroachment of existing structures per CT GIS or aerial imagery. No change to FEMA 100-year regulatory limits.
97+00	6.03	6.13	0.1	Encroachment limits similar to existing conditions for existing structures but no change to FEMA 100-year regulatory limits.
78+75	6.03	6.13	0.1	Encroachment limits similar to existing conditions for existing structures but no change to FEMA 100-year regulatory limits.
76+75	6.03	6.13	0.1	Encroachment limits similar to existing conditions for existing structures but no change to FEMA 100-year regulatory limits.
68+60	6.03	6.12	0.1	Encroachment limits similar to existing conditions for existing structures but no change to FEMA 100-year regulatory limits.
61+50	6.03	6.12	0.1	Encroachment limits similar to existing conditions for existing structures but no change to FEMA 100-year regulatory limits.
55+65	6.02	6.12	0.1	WSE increase in existing wetland/forested area. No encroachment of existing structures per CT GIS or aerial imagery. No change to FEMA 100-year regulatory limits.
45+45	6.02	6.12	0.1	WSE increase contained within airport property. No change to FEMA 100-year regulatory limits.
43+65	5.93	6.03	0.1	Encroachment limits similar to existing conditions for existing structures but no change to FEMA 100-year regulatory limits.

NAVD88	50 Year Storm Event			Notes
River Station	Max Pre-Project WSE (ft, NAVD88)	Max Post-Project WSE (ft, NAVD88)	Change in WSE (ft, NAVD88)	
153+80 (C)	9.19	9.19	0.0	
147+50 (B)	8.70	8.69	0.0	
127+35	7.47	7.43	0.0	
112+80	6.35	6.48	0.1	Encroachment limits similar to existing conditions for existing structures of nearby suburbs but no change to FEMA 100-year regulatory limits.
111+85	6.35	6.47	0.2	WSE increase in existing wetland/forested area. No encroachment of existing structures per CT GIS or aerial imagery. No change to FEMA 100-year regulatory limits.
97+00	6.34	6.47	0.2	Encroachment limits similar to existing conditions for existing structures of nearby suburbs but no change to FEMA 100-year regulatory limits.
78+75	6.34	6.46	0.2	Encroachment limits similar to existing conditions for existing structures but no change to FEMA 100-year regulatory limits.

61+50	6.34	6.46	0.2	Encroachment limits similar to existing conditions for existing structures but no change to FEMA 100-year regulatory limits.
55+65	6.34	6.46	0.2	WSE increase in existing wetland/forested area. No encroachment of existing structures per CT GIS or aerial imagery. No change to FEMA 100-year regulatory limits.
45+45	6.33	6.46	0.2	WSE increase contained within airport property. No change to FEMA 100-year regulatory limits.
43+65	6.26	6.38	0.1	Encroachment limits similar to existing conditions for existing structures but no change to FEMA 100-year regulatory limits.

NOTES:

1. INUNDATION LIMITS TAKEN FROM HOYLE, TANNER HEC-RAS 2D MODEL MAXIMUM WATER SURFACE ELEVATION OUTPUT DATA.
2. INUNDATION LIMITS ASSUME THE RIVERINE STORM PEAK COINCIDES WITH THE PEAK NORMAL TIDE OF LONG ISLAND SOUND.
3. INUNDATION LIMITS ASSUME ALL GATES OF THE TIDE GATE REMAIN IN THE LARGEST OPENED POSITION.

TIDE GATES–OCEAN SIDE–ELEVATION VIEW

SCALE: 3/16" = 1'-0"

GENERAL NOTES:

G–1. GENERAL NOTES SHALL APPLY TO ALL DRAWINGS PREPARED BY HOYLE, TANNER & ASSOCIATES (HTA) AND THE WORK THEY CONVEY.

G–2. ALL WORK SHALL CONFORM TO ALL FEDERAL, STATE AND LOCAL CODES, REGULATIONS AND STANDARDS, THE MORE STRINGENT SHALL GOVERN.

G–3. THE GENERAL CONTRACTOR SHALL SUPERVISE AND DIRECT THE WORK AND SHALL BE SOLELY RESPONSIBLE FOR ALL CONSTRUCTION MEANS, METHODS AND COORDINATION OF OTHER TRADES.

G–4. THESE DOCUMENTS DO NOT INCLUDE THE NECESSARY COMPONENTS FOR CONSTRUCTION SAFETY. CARE OF ADJACENT PROPERTIES DURING CONSTRUCTION AND COMPLIANCE WITH STATE AND FEDERAL REGULATIONS REGARDING SITE SAFETY SHALL SOLELY BE THE CONTRACTORS RESPONSIBILITY.

G–5. ALL DIMENSIONS, ELEVATIONS AND CONDITIONS MUST BE VERIFIED BY THE GENERAL CONTRACTOR OR RESPONSIBLE TRADES PRIOR TO COMMENCING WITH THE WORK, FABRICATION OR ORDERING MATERIALS. DO NOT SCALE DRAWINGS, USE DIMENSIONS SHOWN.

G–6. ANY DISCREPANCIES BETWEEN THESE DRAWINGS AND AS–BUILT CONDITIONS SHALL BE BROUGHT TO THE ATTENTION OF THE ENGINEER IMMEDIATELY, BEFORE PROCEEDING WITH THE WORK.

G–7. THE INFORMATION SHOWN ON THESE PLANS CONCERNING THE TYPE AND LOCATION OF UNDERGROUND UTILITIES IS NOT GUARANTEED TO BE ACCURATE OR ALL INCLUSIVE. THE CONTRACTOR IS RESPONSIBLE FOR MAKING HIS OWN DETERMINATIONS AS TO THE TYPE AND LOCATION OF UNDERGROUND UTILITIES AS MAY BE NECESSARY TO AVOID DAMAGE THERETO.

G–8. ALL APPLICABLE UTILITY DEPARTMENTS AND COMPANIES SHALL BE NOTIFIED BEFORE EXCAVATION IS STARTED. UTILITIES WITHIN 50 FEET OF AN EXCAVATION SHALL BE MARKED IN THE FIELD.

G–9. HOYLE, TANNER & ASSOCIATES, INC. WAIVES ANY AND ALL RESPONSIBILITY AND LIABILITY FOR PROBLEMS THAT ARISE DUE TO THE FAILURE OF THE CONTRACTOR:

G–10. TO FOLLOW THESE DRAWINGS AND SPECIFICATIONS AND THE DESIGN INTENT THEY CONVEY.

—TO NOTIFY HTA OF ANY DISCREPANCIES, ERRORS, OMISSIONS OR CONFLICTS AND OBTAIN THEIR GUIDANCE TO RESOLVE.

—DESIGN CRITERIA

A. DESIGN STANDARD: 2000 INTERNATIONAL BUILDING CODE

B. MOTOR DEAD LOAD: 500 LBS.

C. AASHTO ICE LOADING.

G–11. SEE DRAWING NO. ST1.6 FOR PROPOSED PHASING AND EROSION CONTROL DETAILS.

G–12. WORK FOR THE STANDBY GENERATOR/CONTROL ROOM ENCLOSURE ALSO INCLUDES ALL SUPPORTING STRUCTURAL AND SITE WORK INCLUDING, BUT NOT LIMITED TO EXCAVATION, FOUNDATION, COMPACTION, TOPSOIL, SEED, EROSION CONTROL, ETC.

SECTION A–A

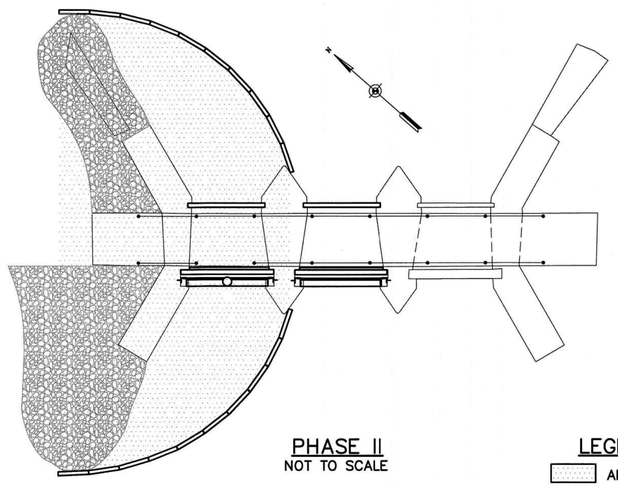
PHASE I, AND TYPICAL SEDIMENT CONTROL

1. INSTALL SEDIMENT CONTROL BASIN AND DEWATERING SUMP PUMP SYSTEM.
2. INSTALL PORTIONS OF COFFERDAMS FOR PHASE I CONSTRUCTION.
3. REMOVE EXISTING TRASH RACK UPSTREAM OF THE TIDE GATES AND EXISTING WOOD TIDE GATE.
4. REPAIR THE SPALLED CONCRETE AREAS AS SHOWN ON "CONCRETE REPAIR DETAIL" AND NOTES ON DWG NO. ST1.9.
5. SAWCUT EXISTING CONCRETE AT GATE POCKETS.
6. INSTALL NEW TRASH RACK AND FLAP GATE WITH FRAME.
7. REMOVE COFFERDAMS OF PHASE I.
8. MOVE SUMP PUMP AND HOSE SYSTEM TO NEXT PHASE, REMOVE SEDIMENT BUILD UP IN BASIN AS NEEDED.

PHASE I, AND TYPICAL SEDIMENT CONTROL
NOT TO SCALE

PHASE II

1. INSTALL PORTIONS OF COFFERDAMS FOR PHASE II CONSTRUCTION.
2. REMOVE EXISTING TRASH RACK UPSTREAM OF THE TIDE GATES AND EXISTING WOOD TIDE GATE.
3. REPAIR THE SPALLED CONCRETE AREAS AS SHOWN ON "CONCRETE REPAIR DETAIL" AND NOTES ON DWG NO. ST1.9.
4. SAWCUT EXISTING CONCRETE AT GATE POCKETS.
5. INSTALL NEW TRASH RACK AND NEW MOTOR OPERATED SLIDE GATE WITH FRAME.
6. INSTALL NEW PRESSURE SENSORS.
7. INSTALL 2'–0" THICK STANDARD RIPRAP PER THE DETAIL SHOWN ON DWG NO. ST1.9 AND TO THE LIMITS SHOWN ON DWG NO. ST1.5
8. REMOVE COFFERDAMS OF PHASE II.
9. MOVE SUMP PUMP AND HOSE SYSTEM TO NEXT PHASE, REMOVE SEDIMENT BUILD UP IN BASIN AS NEEDED.



PHASE II

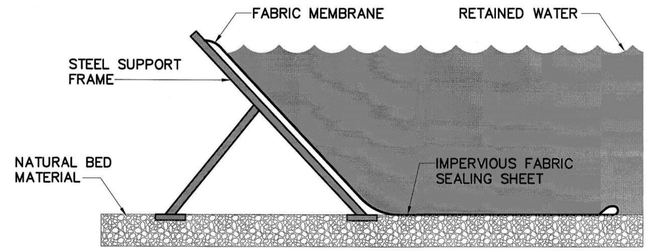
PHASE III
NOT TO SCALE

PHASE III

1. INSTALL PORTIONS OF COFFERDAMS FOR PHASE III CONSTRUCTION.
2. REMOVE EXISTING TRASH RACK UPSTREAM OF THE TIDE GATE AND EXISTING WOOD TIDE GATE.
3. REPAIR THE SPALLED CONCRETE AREAS AS SHOWN ON "CONCRETE REPAIR DETAIL" AND NOTES ON DWG NO. ST1.9. RECHINK LOWER 4' OF EXISTING RETAINING WALL UPSTREAM OF TIDE GATE.
4. SAWCUT EXISTING CONCRETE AT GATE POCKETS.
5. INSTALL NEW TRASH RACK AND NEW MOTOR OPERATED SLIDE GATE WITH FRAME.
6. INSTALL 2'–0" THICK STANDARD RIPRAP PER THE DETAIL SHOWN ON DWG NO. ST1.9 AND TO THE LIMITS SHOWN ON DWG NO. ST1.5
7. REMOVE COFFERDAMS OF PHASE III AND SETTLING BASIN, SWALE AND CHECK DAM.

PHASE IV

1. COMPLETE ALL REMAINING WORK: INSTALL SECURITY FENCE, PERIMETER FENCING, FILL VOIDS UNDER APPROACH WALKWAY SLAB, ETC.
2. DREDGE CHANNEL BOTTOM IN AREA WHERE STANDARD RIP RAP (D 50 =1.5') IS PROPOSED, TO A DEPTH OF 1.5' (±) BELOW EXISTING GRADE, AND PLACE (D 50= 1.5') STONE. PROTECT DOWNSTREAM WITH TURBIDITY CURTAIN DURING PHASE IV STEP 2.



TYPICAL COFFERDAM SECTION
NOT TO SCALE

COFFERDAM NOTES:

1. COFFERDAMS SHALL BE REQUIRED AT EACH CONSTRUCTION PHASE TO CONTROL WATER INFLOW AND ADEQUATELY DEWATER THE WORKING AREAS. SUMP PUMPING AREAS AROUND THE ENTIRE PERIMETER WILL BE REQUIRED TO ADEQUATELY CONTROL THE WATER WITHIN THE WORKING AREAS.
2. A PORTA–DAM COFFERDAM SYSTEM IS SHOWN HERE FOR CONCEPT ONLY. THE CONTRACTOR SHALL PROVIDE TO THE ENGINEER SHOP DRAWINGS AND DESIGN CALCULATIONS OF THE SELECTED COFFERDAM SYSTEM FOR APPROVAL PRIOR TO BEGINNING OF CONSTRUCTION.
3. WATER PUMPED FROM DEWATERING LOCATIONS SHALL BE FILTERED ADEQUATELY TO REMOVE FINE MATERIALS PRIOR TO RETURNING THE WATER TO THE RIVER. ACTUAL LOCATION OF SEDIMENTATION BASIN TO BE DETERMINED BY THE CONTRACTOR AND APPROVED BY THE ENGINEER PRIOR TO INSTALLATION OF COFFERDAMS.

LIFT/FLAP GATE NOTES:

1. THE LIFT GATE AND FLAP GATE SHOWN ARE BASED UPON THE 'GLYDASEAL GATES' AND 'FLAP VALUE' PRODUCTS MANUFACTURED BY THE RODNEY HUNT COMPANY OF ORANGE, MA (978544–2511) AND ARE ACCEPTABLE FOR THIS PROJECT. THE CONTRACTOR MAY SUBMIT PRODUCTS FROM THIS MANUFACTURER OR ANY OTHER THAT MEETS THE SPECIFICATIONS AND DESIGN INTENT AND GEOMETRY SHOWN HERE.
2. THE LIFT GATE AND FLAP GATE MANUFACTURER SHALL BE RESPONSIBLE FOR DESIGNING THE GATE, FRAME AND ALL CONNECTIONS OF THE TIDE GATE FRAME TO CONCRETE SURFACES.

SCALE: 1" = 1'–0"

CONCRETE AND REINFORCING STEEL NOTES:

1. THE CONTRACTOR WILL NOTIFY THE ENGINEER A MINIMUM OF 24 HOURS IN ADVANCE OF ALL CONCRETE OPERATIONS.
2. ALL CONCRETE WORK SHALL COMPLY WITH THE LATEST A.C.I. SPECIFICATIONS.
3. ALL CONCRETE SHALL HAVE A MINIMUM COMPRESSIVE STRENGTH OF 5,000 PSI AT 28 DAYS.
4. ALL REINFORCING STEEL SHALL CONFORM TO ASTM A615 GRADE 75 (MMFX 2) AND SHALL BE DETAILED, FABRICATED AND INSTALLED IN ACCORDANCE WITH THE LATEST A.C.I. SPECIFICATIONS.
5. MAXIMUM ALLOWABLE SLUMP OF CONCRETE SHALL NOT EXCEED 4".
6. ALL CONCRETE SHALL BE AIR ENTRAINED A MINIMUM OF 6%.
7. PROVIDE A CLEAR COVER FROM REINFORCING STEEL TO ADJACENT CONCRETE SURFACES AS FOLLOWS:

   CONCRETE CAST AGAINST AND PERMANENTLY EXPOSED TO EARTH = 3".
   CONCRETE EXPOSED TO WEATHER = 2".

   THESE DIMENSIONS SHALL BE CONSIDERED ACTUAL AND ARE NOT TO BE ADJUSTED IN EITHER DIRECTION.
8. SUBMIT REINFORCING SHOP DRAWINGS FOR REVIEW BY THE ENGINEER.
9. FOR CONSTRUCTION DURING HOT WEATHER, ALL CONCRETE WILL REQUIRE PROTECTION FROM HIGH TEMPERATURES IN ACCORDANCE WITH ACI 305.
10. FIELD FABRICATION OR CUTTING OF REINFORCING STEEL WILL NOT BE PERMITTED WITHOUT THE APPROVAL OF THE ENGINEER.
11. ALL EXPOSED CONCRETE EDGES SHALL BE CHAMFERED ¾" UNLESS NOTED OTHERWISE.
12. WATER REPELLENT (SILANE–SILOXANE), SHALL BE APPLIED TO ALL EXPOSED CONCRETE SURFACES OF THE TIDE GATE AND WINGWALLS.

"AS-BUILT"

I HEREBY CERTIFY THAT TO THE BEST OF MY KNOWLEDGE, BASED UPON CONSTRUCTION RECORDS PROVIDED BY THE CONTRACTOR, THAT ALL WORK SHOWN ON THIS DRAWING HAS BEEN COMPLETED AS SHOWN.

CONCRETE REPAIR DETAIL
NOT TO SCALE

NOTES:

1. THE INTENTION OF THIS WORK IS TO REPAIR THE ENTIRE AREA OF CONCRETE WINGWALL AND TIDE GATE BELOW EL. 1.0. SAWCUT THE EDGE OF CONCRETE REPAIR AREA DEFINED AS FOLLOWS: THE VERTICAL LIMIT OF THE NEW CONCRETE FACING SHALL BE FROM THE BASE OF THE WINGWALL OR TIDE GATE TO EL. 1.0. THE HORIZONTAL LIMIT INCLUDES ALL FACES OF THE WINGWALLS AND TIDE GATE EXPOSED TO WATER.
2. PREPARE THE REPAIR AREA BY REMOVAL OF ALL UNSOUND CONCRETE TO A DEPTH OF 1½" MIN. FEATHERED REMOVAL EDGES WILL NOT BE PERMITTED. JACKHAMMERS HEAVIER THAN NOMINAL 15 POUND CLASS SHALL NOT BE USED.
3. AFTER CONCRETE REMOVAL, THE REPAIR AREA SHALL BE THOROUGHLY CLEANED OF INJURIOUS RUST, CONCRETE, DIRT, GREASE, OR ANY OTHER BOND INHIBITING MATERIAL.
4. INSTALL EPOXY COATED OR STAINLESS STEEL ANCHORS IN ALL REPAIR AREAS GREATER THAN 2" IN DEPTH. THE ANCHOR SHALL EXTEND A MINIMUM OF THREE INCHES INTO THE EXISTING MATERIAL AND HAVE A 2" LONG BENT END RETURN WITH 2" COVER MIN. ANCHORS SHALL BE A #3 REBAR OR EQUIVALENT SPACED AT 6" ON CENTER.
5. COAT ALL REPAIR SURFACES WITH AN APPROVED BONDING AGENT PRIOR TO PLACING REPAIR MATERIAL.
6. INSTALL SMOOTH FACED FORMS OVER THE ENTIRE REPAIR AREA AND PLACE A VERTICAL EPOXY REPAIR MORTAR. CONCRETE WILL NOT BE ALLOWED. THE REPAIR MORTAR SHALL BE INSTALLED IN ACCORDANCE WITH THE MANUFACTURER'S RECOMMENDED PROCEDURES AND SHALL CONTAIN AN APPROVED FIBER REINFORCEMENT.

Fences shall be grounded on each side of every gate, at points 150 feet (45.7 m) on each side of high-tension line crossings, and at 150-foot (47.5 m) intervals along the fence where high tension lines (as defined by ANSI C2) are directly overhead and run parallel to the fence. Fences shall be ground every 1,000 feet to 1,500 feet of length when fence are in isolated places and at lesser distances depending on proximity of fence to public roads, highways, and buildings. The ground shall be accomplished with a copper clad rod 10 feet long and a minimum of 3/4 inch in diameter driven vertically until the top is 6 inches below the ground surface. A No. 6 solid copper conductor shall be clamped to the rod and to the fence in such a manner that each element of the fence is grounded.

TWEED NEW HAVEN REGIONAL AIRPORT (HVN) RUNWAY EXTENSION AND TERMINAL EXPANSION PROJECT - INLAND WETLANDS/WATERCOURSES AND WQC & TIDAL WETLANDS AND WQC APPLICATION

ATTACHMENT 20 – NATURAL DIVERSITY DATA BASE (NDDB)

April 15, 2025

Deb Coon
Hoyle, Tanner and Associates
150 Dow Street
Manchester, NH 03101

NDDB Final Determination
Project: Tweed New Haven Airport Runway Extension and Terminal Expansion
Filing ID 107828
NDDB Determination 202402808
Expiration: April 15, 2027

Dear Ms. Coon,

We have reviewed Natural Diversity Database maps and files regarding the area delineated on the map provided for the proposed Tweed New Haven Airport Runway Extension and Terminal Expansion project in New Haven, Connecticut. According to our information, the following species have been documented within the vicinity of the work to be conducted:

Plants

- Yellow thistle (*Cirsium horridulum*) – State Endangered
  - Habitat: Coastal grasslands; airports; open-canopy trailsides and roadsides; inner salt marsh borders; *Juniperus-Panicum virgatum* communities, scrub communities, and forest edges bordering salt marshes.
  - Blooms June – July.
- Saltpond grass (*Leptochloa fusca ssp. fascicularis*) – State Endangered
  - Habitat: Coastal, in brackish ponds and shores of "salt ponds", borders of salt and brackish marshes, sandy depressions in coastal grasslands and sandy roadsides that are flooded by the highest mesohaline or polyhaline spring tides of the year. Populations found inland growing along highways are not believed to be of native Connecticut provenance.
  - Blooms and fruits August – November.
- Field paspalum (*Paspalum laeve*) – State Threatened
  - Habitat: Mostly near the coast, extending inland in the Connecticut River towns only as far as Cromwell and Glastonbury, and disjunct as a historic in Franklin. Hydric to moderately well drained fields, meadows, grasslands, floodplain grasslands and meadows, thickets, and shores, seasonally flooded and exposed open-canopy vernal pools. Utility ROWs, airports near the coast. Tolerant of mowing, at least at some sites. Critical Habitats include: Alluvial Grassland/Outcrop; Grassland Subtype: Coastal Grassland.
  - Fruits August – October.
- Two-flowered Cynthia (*Krigia biflora*) – State Threatened

  - Habitat: Dry to wet meadows, fields, rocky woods, and roadsides.
  - Blooms Jun.
- Hoary plantain (*Plantago virginica*) – State Special Concern
  - Habitat: Dry acidic or basic, rocky, sandy, or gravelly soil. Pastures, grasslands, floodplain levee and stream bank forests, roadsides, low traprock outcrops in old fields, calcareous (high-pH) open woodlands, dry fields, gravel banks, traprock ridges. Critical Habitats: Subacidic Rocky Summit/Outcrop; Subacidic Rocky/Summit Outcrops (probably); Floodplain Forest, High Floodplain Subtype; Dry Circumneutral Forest.
  - Blooms/fruits May – June. Spring and early summer ephemeral, typically disappearing by late June.

NDDB has received and reviewed the *Tweed New Haven Regional Airport Runway Extension and Terminal Expansion Rare Plant Survey Report and Protection Plan*, *December 2024, Revised March 2025 (The Report and Protection Plan)*. Note that *The Report and Protection Plan* addresses both the Runway Extension and Terminal Expansion (NDDB 202402808, Filing 107828), as well as the Tide Gate Alteration components of the project (NDDB 202408268, Filing ID 117005). NDDB has additional information from botanist Tom Groves provided via email correspondence dated April 10, 2025. This information is relative to Runway Extension and Terminal Expansion activities and is addressed and incorporated in this review.
NDDB accepts the information provided in *The Report and Protection Plan*, with modification of the Protection Plan (see below). A summary of *The Report and Protection Plan* information and additional correspondence relative to Runway Extension and Terminal Expansion activities is described below. *The Report and Protection Plan* and additional correspondence is attached to this determination.

- The rare species occurrences and highest plant species diversity was observed in the open airfield area, along the edges of open habitat, and where the new terminal construction is proposed on the southeastern part of the property.
- Field Paspalum (*Paspalum laeve*)

  - Field paspalum (*Paspalum laeve* var. *circulare*) occurs throughout the upland and wetland portions of the airfield survey area in various densities. This species was observed in areas that will be disturbed by the Runway Extension, Terminal Expansion, and Tuttle Brook. The highest density areas total approximately 19 acres and account for between 66.92% - 68.15% of the total extant population. These sections are primarily outside of the project impact limits except for 2 acres where turf to turf conversion is proposed.

  - The largest single impact will be in the Terminal Expansion Area, estimated at maximum of 1 acre of direct impact.

  - Project related land conversion alterations from terrestrial habitat (pervious) to pavement (impervious) will impact an estimated 2.51% to 3.53% of the extant field paspalum population. Other non-permanent impacts, such as turf to turf conversions have the potential to impact between 52.39% - 53.25% of the extant population.

If the protection measures for Field paspalum set forth below are implemented, I do not anticipate significant impacts to state listed plant species resulting from this project.

Modified Protection Plan for Field Paspalum

1. Due to the observed negative impact of hydroseeding using non-native species on the existing field paspalum population, it is recommended that seeding of any kind be abandoned as a revegetation strategy on the airfield at any location where this rare species occurs. Otherwise, Turf-to-Turf (TTT) conversions have the potential to reduce field paspalum populations dramatically if hydroseeding with non-native species is used following the construction phase of this project. There are 8 specific locations where both TTT and Pavement-to-Turf (PTT) land conversion is proposed, and field paspalum is present. These locations (see Rare Plants Map in Appendix A), totaling 31 acres, will be allowed to revegetate naturally from the existing seed bank (Table 7). Promoting the growth of field paspalum in these areas will compensate for plants lost to the footprint of the new terminal. Based on the average seed count per individual plant collected during the 2024 seed collection, it is conservatively estimated that 4 to 8 million seeds are present across the survey area. Specifically in the proposed TTT land conversion areas, the estimate is 1.89 – 3.75 million seeds (Table 7). Only 1.18% of the available seed bank in these TTT areas would need to germinate to replace the number of individuals potentially lost in the Terminal Expansion Area.

2. Compensation for plants lost to the footprint of the new terminal will also be provided if areas where PTT conversions remove pavement are allowed to revegetate naturally. If erosion controls are required to satisfy BMPs, a biodegradable, stable, product like BioNet Biodegradable Erosion Control Blankets will be used to stabilize soil and limit erosion to meet Federal Aviation Administration (FAA) regulations without the use of non-native or non-local ecotype seed stock. These small areas of PTT conversion are proposed in Tweed New Haven Airport Sections 1 – 4, 6 – 9, 14 – 15, 18, 20 – 21 and 23. The approximate size of these specific PTT conversions where rare plants occur totals 1.44 acres. Refer to Appendix A of *The Report and Protection Plan* for maps of these locations.

3. To retain the seed bank present for the TTT land conversion portion of this project, topsoil in each TTT area will be segregated to retain any potential field paspalum seeds present. At the completion of construction, the topsoil will be returned to each area where grading has occurred. The naturally revegetated areas total 31 acres.

4. Future monitoring of these sites is required for 5 growing seasons after the topsoil has been returned to the TTT areas and PTT areas to determine if natural revegetation of field paspalum is occurring in select areas where TTT land conversion disturbed the soil. If field paspalum recruitment is low in years post-construction, seeds collected during the 2024 growing season will be contract grown and transplanted onto the sites (31 acres) of previous occurrence. Yearly monitoring reports, including counts or scientifically robust statistical estimates of numbers of genets, assessments of population vigor, and rates of increase or decrease, shall be submitted to DEEEP NDDB (deep.nddbrequest@ct.gov) by Dec. 31 of each year of monitoring.

5. Secondary mitigation involves seed collection. Seed collection was approved, conducted, and completed during the mature fruiting window in November 2024. If the primary mitigation strategy fails, transplanting field paspalum plugs from contract-grown seed collected in 2024 to revegetate the site would provide mitigation post construction. The number of the seeds collected (8,464) from the Terminal Expansion Area are estimated to be 3.7X to 5.3X the number of plants represented by the

potential taking of this species.

6. Monitoring of the mitigation areas will occur annually until one of the two following criteria is met. Stipulation 1, the population has exceeded a 3:1 ratio based on the highest total impact numbers to this species (44,098) i.e. a total repopulation estimate of the converted areas exceeds 132,294. Or Stipulation 2, the area has been monitored for five years without sufficient recruitment to meet stipulation one, but the population has approximately met and/or substantially exceeds the highest total impact numbers to this species (44,098). This stipulation triggers an evaluation a consultation with DEEP NDDB and evaluation of the observed rate of increase in the population over the 5 years of monitoring. If, based on the observed rate of increase over the last 5 years, it appears clear that the population is likely to meet the Stipulation 1 population target eventually, NDDB may consider the mitigation complete, at NDDB's sole discretion. Or Stipulation 3, the area has been monitored for five years without sufficient recruitment to meet stipulation 1, and the population is substantially less than the highest total impact numbers to this species (44,098). This situation triggers a request for the 2024 collected seed to be grown by Native Plant Trust and replacement plugs of this species are planted into the 8conversion areas. Planting of the plugs into the 8 conversion areas will restart the monitoring clock, and yearly monitoring shall continue for 5 more years, or until the population meets the criteria of Stipulation 1 or 2.

- Saltpond grass (*Leptochloa fusca* var. *fasciculata*) was observed in two distinct locations. Neither of these areas are within the footprint of the proposed Airport projects, and therefore these plants will not experience any impact from these projects.

Grassland Birds

- Grasshopper sparrow (*Ammodramus savannarum*) – State Endangered
- Horned lark (*Eremophila alpestris*) – State Endangered
- Eastern meadowlark (*Sturnella magna*) – State Threatened
- Bobolink (*Dolichonyx oryzivorus*) – State Special Concern
- Savannah sparrow (*Passerculus sandwichensis*) – State Special Concern

On April 9, 2025, NDDB was provided with the document *DRAFT Grassland Bird Habitat Mitigation Plan Developed for Pre-application Review*. NDDB understands this to be the final version of the document. NDDB has reviewed the document and finds the proposed measures acceptable as mitigation for impacts to state-listed grassland bird species. A copy of this document is included as an attachment to this letter. In summary, the Plan proposes:

- Establishment of a dedicated grassland bird conservation site at the 76-acre Warren Property in Eastford, Connecticut. The site features a mix of grassland, floodplain, and forested areas, with over 25 acres of grassland fields and low-vegetation habitat areas designated for enhancement and permanent protection.
- The site will be managed as an early successional grassland bird habitat in perpetuity.
- Conduct pre-enhancement bird surveys and annual follow-up surveys (beginning in 2028)
- Short-term period (five years) of habitat enhancement and adaptive management including:
  - seeding of native grassland species
  - selective removal of patches of invasive and undesired woody vegetation
  - implementation of a rotational mowing strategy to prevent woody encroachment

- Long-term adaptive management performed in perpetuity, to be informed by annual vegetative surveys and follow-up bird surveys. Approaches include:
  - annual mowing (rotational – 1/3 per year)
  - selective vegetation control and shrub management
  - removal of invasive species
  - periodic monitoring. NDDB recommends utilizing volunteers for supplemental monitoring efforts.
- Partnership with Joshua's Trust – After the initial 5-year period, either ownership or a conservation easement will be enacted with Joshua's Tract Conservation and Historic Trust, Inc (Joshua's Trust), who will then provide management in perpetuity

Additional details are available in the Plan document.

Instructions for submitting survey information and other additional reporting requirements relative to the Grassland Bird Habitat Mitigation Plan can be found at the end of this letter.

Your submission information indicates that your project requires a state permit, license, registration, or authorization, or utilizes state funding or involves state agency action. This Final NDDB Determination for Tweed New Haven Airport Runway Extension and Terminal Expansion may be utilized to fulfill the Endangered and Threatened Species requirements for state-issued permit applications, licenses, registration submissions, and authorizations.

Please be aware of the following limitations and conditions:
Natural Diversity Database information includes all information regarding listed species available to us at the time of the request. This information is a compilation of data collected over the years by the Department of Energy and Environmental Protection's Natural History Survey and cooperating units of DEEP, landowners, private conservation groups and the scientific community. This information is not necessarily the result of comprehensive or site-specific field investigations. Current research projects and new contributors continue to identify additional populations of species and locations of habitats of concern, as well as enhance existing data. Such new information is incorporated into the Database and accessed through the ezFile portal as it becomes available. New information may result in additional review, and new or modified restrictions or conditions may be necessary to remain in compliance with certain state permits.

- During your work listed species may be encountered on site. A report must be submitted by the observer to the Natural Diversity Database promptly and additional review and restrictions or conditions may be necessary to remain in compliance with certain state permits. Please fill out the appropriate survey form and follow the instructions for submittal.
- Your project involves the state permit application process or other state involvement, including state funding or state agency actions; please note that consultations with your permit analyst or the agency may result in additional requirements. In this situation, additional evaluation of the proposal by the DEEP Wildlife Division may be necessary and additional information, including but not limited to species-specific site surveys, may be required. Any additional review may result in specific restrictions or conditions relating to listed species that may be found at or in the vicinity of the site.
- If your project involves preparing an Environmental Impact Assessment, this NDDB consultation and determination should not be substituted for biological field surveys assessing on-site habitat and species presence.

- The Final NDDB determination for the Tweed New Haven Airport Runway Extension and Terminal Expansion, New Haven, as described in the submitted information and summarized at the end of this document is valid until April 15, 2027. This determination applies only to the project as described in the submission and summarized at the end of this letter. Please re-submit an updated Request for Review if the project's scope of work and/or timeframe changes, including if work has not begun by April 27, 2027.

Additional reporting requirements indicated above have been requested. Include the Project Name (Tweed New Haven Airport Runway Extension and Terminal Expansion, Filing ID (107828) and Determination Number 202402808 on all correspondence. Forward additional reporting requirements to each of the following two addresses:

1. robin.blum@ct.gov
2. DEEP.nddbrequest@ct.gov

Project: Tweed New Haven Runway Extension and Terminal Expansion – Tide Gate Alteration
NDDB 202408268 Final Determination
Filing ID: 117005
Expiration date: April 16, 2027

Dear Deb Coon,

We have received and reviewed the materials submitted pursuant to a Natural Diversity Data Base review request for Tide Gate Alteration at Tweed Airport, New Haven project. According to our records, populations of State listed species have been documented in the vicinity of the project area.

Plants:

- Yellow thistle (*Cirsium horridulum*) – State Endangered
  Habitat: Coastal grasslands; airports; open-canopy trail sides and roadsides; inner salt marsh borders; *Juniperus-Panicum virgatum* communities, scrub communities, and forest edges bordering salt marshes.
  Blooms: June, July
- Salt pond grass (*Leptochloa fusca ssp. Fascicularis*) – State Endangered
  Habitat: Coastal, in brackish ponds and shores of "salt ponds", borders of salt and brackish marshes, sandy depressions in coastal grasslands and sandy roadsides that are flooded by the highest mesohaline or polyhaline spring tides of the year. Populations found inland growing along highways are not believed to be of native Connecticut provenance.
  Blooms and fruits August - November
- Field paspalum (*Paspalum laeve*) - State Threatened
  Habitat: Mostly near the coast, extending inland in the Connecticut River towns only as far as Cromwell and Glastonbury, and disjunct as a historic in Franklin. Hydric to moderately well drained fields, meadows, grasslands, floodplain grasslands and meadows, thickets, and shores, seasonally flooded and exposed open-canopy vernal pools. Utility ROWs, airports near the coast. Tolerant of mowing, at least at some sites. Critical Habitats include: Alluvial grassland/Outcrop, Grassland Subtype; Coastal Grassland.
  Fruits August – October
- Swamp lousewort (*Pedicularis lanceolata*) – State Threatened
  Habitat: Moist fields, swamp edges, wet ground, wet meadows, open swamps, stream edges, fresh tidal wetlands.
  Blooms mid-August, September
- Two-flowered cynthia *(Krigia biflora*) - State Threatened
  Habitat: Dry to wet meadows, fields, rocky woods, and roadsides.
  Blooms June
- Hoary plantain (*Plantago virginica*) – State Special Concern

Habitat: Dry acidic or basic, rocky, sandy, or gravelly soil. Pastures, grasslands, floodplain levee and stream bank forests, roadsides, low traprock outcrops in old fields, calcareous (high-pH) open woodlands, dry fields, gravel banks, traprock ridges. Critical Habitats: Subacidic Rocky Summit/Outcrop; Subacidc Rocky/Summit Outcrops (probably); Floodplain Forest, High Floodplain Subtype; Dry Circumneutral Forest. Blooms/fruits May-June. Spring and early summer ephemeral, typically disappearing by late June.

- New England blazing star (*Liatris novae-angliae*) – State Special Concern
  Habitat: Sandplains, dry fields, sandy sea beaches, rock outcrops, sandy or rocky roadsides.
  Blooms Aug, September

NDDB has received and reviewed the *Tweed New Haven Regional Airport Runway Extension and Terminal Expansion Rare Plant Survey Report and Protection Plan*, *December 2024, Revised March 2025 (The Report and Protection Plan)*. Note that *The Report and Protection Plan* addresses both the Runway Extension and Terminal Expansion (NDDB 202402808, Filing 107828), as well as the Tide Gate Alteration components of the project (NDDB 202408268, Filing ID 117005). NDDB has additional information from botanist Tom Groves provided via email correspondence dated April 10, 2025. This information is relative to Runway Extension and Terminal Expansion activities and is addressed and incorporated in the NDDB review of those project activities. NDDB accepts the information provided in *The Report and Protection Plan*. A summary of *The Report and Protection Plan* information relative to Tide Gate Alteration activities is described below, and *The Report and Protection Plan* is attached to this determination.

- Survey work conducted between October 16 – 17 included a vegetative community and habitat suitability assessment in the Tide gate Alteration Area to estimate the likelihood of target species presence in selected locations. The survey was broadened to include any plant species within the species' genera because the survey was conducted outside of the proper flowering window for most of the target species.
- There were no observations made of any target species in the tide gate alteration area during the October 2024 surveys. Due to a moderate to heavy density of common reed in this survey area, and the density of common reed thatch covering the soil, the habitat in the tide gate alteration area is unsuitable for any of the target species.
- Tide gate alteration impact areas were increased by 3.8 acres after the 2024 field season. Therefore, a presumed presence approach will be utilized for seven state-listed species. The need to implement any of the suggested mitigation strategies will be verified by BSC Botanists during the 2025 field season. Of note, NDDB has indicated to BSC botanist that suitable habitat is likely only for yellow thistle (*Cirsium horridulum*) and therefore survey work should focus on this species. However, given the limited acreage that needs to be covered, BSC botanists should give consideration to all seven target species.
  - Mitigation strategies for the seven target species will all involve seed collection. Collected seeds will be sorted, counted and labeled according to Native Plant Trust NEPCoP Seed Collection Protocols and stored with NASAMI Farm for propagation.
  - Yellow thistle (E) – This perennial will be transplanted if observed within the additional survey areas. Transplanting this species will include a site assessment of the current location, associated species, elevation, soil type, moisture content and habitat characteristics to determine the best transplant location site on airport property.
  - Two flowered cynthia (T) – As a perennial species, transplanting any observed individuals to a similar location based on collected in situ habitat characteristics to include associated species, elevation, soil type, moisture content and habitat characteristics will be used to locate a suitable transplanting location that is buffered from any present or future project impacts.
  - Saltpond grass (E) – If this species is observed in any of the 2025 survey locations, individuals will be transplanted 200 feet north of Pig Farm Road to an area where a subpopulation is already known to occur. This area has existing available habitat and is protected from airport project impacts.
  - Field paspalum (T) – Observed individuals of this species will be transplanted to non-impacted locations 200 feet north of Pig Farm Road where a subpopulation of this species is already known to occur.

- Swamp lousewort (T) – If this species is observed a meter-by-meter plot will be created around any individual or population. Both vegetative and abiotic factors within the plot will be recorded and used to determine a suitable transplanting location elsewhere on the Tweed New Haven Airport Property. A suitable new location for transplants will have a similar host vegetation, especially to include similar species composition and densities of graminoids and composites.
- New England blazing star (SC) – If this species is observed, individuals will be transplanted to non-impacted locations. The area 200 feet north of Pig Farm Road where other rare plants occur has available suitable sandy exposed habitat.
- Hoary plantain (SC) - If this species is observed, individuals will be transplanted to non-impacted locations. The area 200 feet north of Pig Farm Road where other rare plants occur has available suitable sandy exposed habitat.
- Translocation sites may require habitat management or invasive plant management to create suitable conditions for the target species.
- Monitoring of transplant areas will take place during the appropriate identification windows for each species. Monitoring is recommended to occur in any transplant location for up to five years. If at any time during these five years the population fails to meet the required species recruitment ratio, additional plants will be requested to be grown by Native Plant Trust for further transplantation.
- Adaptive management during these five years may be required to alter, expand, or manage the selected transplant site to enhance available habitat for the transplants if population numbers are declining.

Grassland Birds:

- Grasshopper sparrow (*Ammodramus savannarum*) – State Endangered
- Eastern meadowlark (*Sturnella magna*) – State Threatened
- Savannah sparrow (*Passerculus sandwichensis*) – State Special Concern
- Bobolink (*Dolichonyx oryzivorus*) – State Special Concern

In association with the NDDB review of the Runway Extension and Terminal Expansion portion of this project (NDDB 202402808 Filing 107828), the Grassland Bird Habitat Mitigation Plan, dated April 2025 was provided to NDDB on April 9, 2025. NDDB has reviewed and accepted this plan to mitigate for impacts to grassland birds from project activities implemented under the Runway Extension and Terminal Expansion project and the Tide Gate Alteration project. The Grassland Bird Habitat Mitigation Plan is attached and made part of this determination.

Fish:

- Sand tiger shark (*Carcharias taurus*) – State Special Concern
- Atlantic seasnail (*Liparis atlanticus*) – State Special Concern
- Radiated shanny (*Ulvaria subbifurcata*) – State Special Concern

Contact a DEEP Fisheries Biologist for more information regarding potential impacts to listed fish species. You may need to submit a fisheries consultation form.

Your submission information indicates that your project requires a state permit, license, registration, or authorization, or utilizes state funding or involves state agency action. This NDDB - New determination may be utilized to fulfill the Endangered and Threatened Species requirements for state-issued permit applications, licenses, registration submissions, and authorizations.

Please be aware of the following limitations and conditions:
Natural Diversity Database information includes all information regarding listed species available to us at the time of the request. This information is a compilation of data collected over the years by the Department of Energy and Environmental Protection's Natural History Survey and cooperating units of DEEP, land owners, private conservation groups and the scientific community. This information is not necessarily the result of

comprehensive or site-specific field investigations. Current research projects and new contributors continue to identify additional populations of species and locations of habitats of concern, as well as enhance existing data. Such new information is incorporated into the Database and accessed through the ezFile portal as it becomes available. New information may result in additional review, and new or modified restrictions or conditions may be necessary to remain in compliance with certain state permits.

- During your work listed species may be encountered on site. A report must be submitted by the observer to the Natural Diversity Database promptly and additional review and restrictions or conditions may be necessary to remain in compliance with certain state permits. Please fill out the appropriate survey form and follow the instructions for submittal.
- Your project involves the state permit application process or other state involvement, including state funding or state agency actions; please note that consultations with your permit analyst or the agency may result in additional requirements. In this situation, additional evaluation of the proposal by the DEEP Wildlife Division may be necessary and additional information, including but not limited to species-specific site surveys, may be required. Any additional review may result in specific restrictions or conditions relating to listed species that may be found at or in the vicinity of the site. If your project involves preparing an Environmental Impact Assessment, this NDDB consultation and determination should not be substituted for biological field surveys assessing on-site habitat and species presence.
- The NDDB - New determination for the Tweed New Haven Runway Extension and Terminal Expansion – Tide Gate Alteration as described in the submitted information and summarized at the end of this document is valid until 4/16/2027. This determination applies only to the project as described in the submission and summarized at the end of this letter. Please re-submit an updated Request for Review if the project's scope of work and/or timeframe changes, including if work has not begun by 4/16/2027.

1. Executive Summary

This Grassland Bird Habitat Mitigation Plan is submitted in support of the proposed Tweed New Haven Regional Airport (Airport) Runway Extension and Terminal Expansion Project (the Proposed Project) on behalf of the Tweed New Haven Airport Authority (TNHAA) and The New HVN, LLC.

The Proposed Project will impact 3.96 acres of grassland bird habitat that was created as a prior permit condition. This Plan has been developed to serve as mitigation for the loss of grassland bird habitat at the Airport resulting from those impacts and the continuation of the current grassland management regime.

The objective of this mitigation plan is to enhance and preserve an existing grassland ecosystem to support biodiversity, including grassland birds, particularly targeting the conservation needs of the targeted species, savannah sparrow.

The mitigation plan establishes a dedicated grassland bird conservation site at the Warren Property in Eastford, Connecticut. The 76-acre mitigation site features a mix of grassland, floodplain, and forested areas, with over 25 acres of grassland fields and low-vegetation habitat areas designated for enhancement and permanent protection. The site is currently managed for agriculture but upon commencement of the mitigation plan, the site will be managed as an early successional grassland bird habitat in perpetuity. The presence of Bungee Brook and its floodplain provides critical resources for grassland bird species and enhances habitat connectivity. This site's proximity to protected lands, its existing habitat conditions, and its documented use by grassland species make it a suitable and strategic location for the mitigation.

A central focus of the plan is a five-year period of habitat enhancement and adaptive management achieved through the seeding of native grassland species, the selective removal of patches of invasive and undesired woody vegetation, and the implementation of a rotational mowing strategy to prevent woody encroachment. These practices will create high-quality, diverse grassland ecosystems that support the ecological needs of grassland bird species and other wildlife.

Long-term management is a cornerstone of the plan, establishing a perpetual framework to ensure the sustainability of the grassland habitat. Adaptive management, including the rotational mowing schedule in the late fall and ongoing vegetation management will continue in perpetuity, to forever maintain the open landscape and preserve its ecological integrity. By fostering an environment that supports a variety of grassland-dependent species, the plan aims to promote biodiversity and enhance the site's overall ecological value.

Collaboration with the landowners of the property, the Warrens, and a local conservation organization, Joshua's Trust, strengthens the plan's long-term success, creating a model for preserving Connecticut's declining grassland habitats and the species that depend on them. This mitigation plan exemplifies a steadfast commitment to ecological stewardship and the sustainable management of critical natural resources.

This grassland mitigation plan has been revised to address comments from the Connecticut DEEP's Natural Diversity Database (NDDB) Wildlife Biologist and includes modifications to accommodate

brown thrasher (*Toxostoma rufum*) habitat while maintaining suitable conditions for savannah sparrows. Mitigation plan updates include strategic retention of shrub patches, vegetation and invasive species management to be performed by Joshua's Trust in the long-term, a revised mowing regime to promote habitat diversity, and annual follow-up bird surveys beginning in spring 2028 to assess habitat usage and inform adaptive management. Joshua's Trust is committed to the long-term management described herein.

2. Proposed Project Introduction

The Tweed New Haven Regional Airport (Airport) Runway Extension and Terminal Expansion Project (the Proposed Project) consists of the extension and strengthening of Runway 02-20, drainage improvements and the replacement of the existing West Terminal with a new terminal ("East Terminal") on previously disturbed land on the east side of the Airport property (Figure 1 Proposed project location).

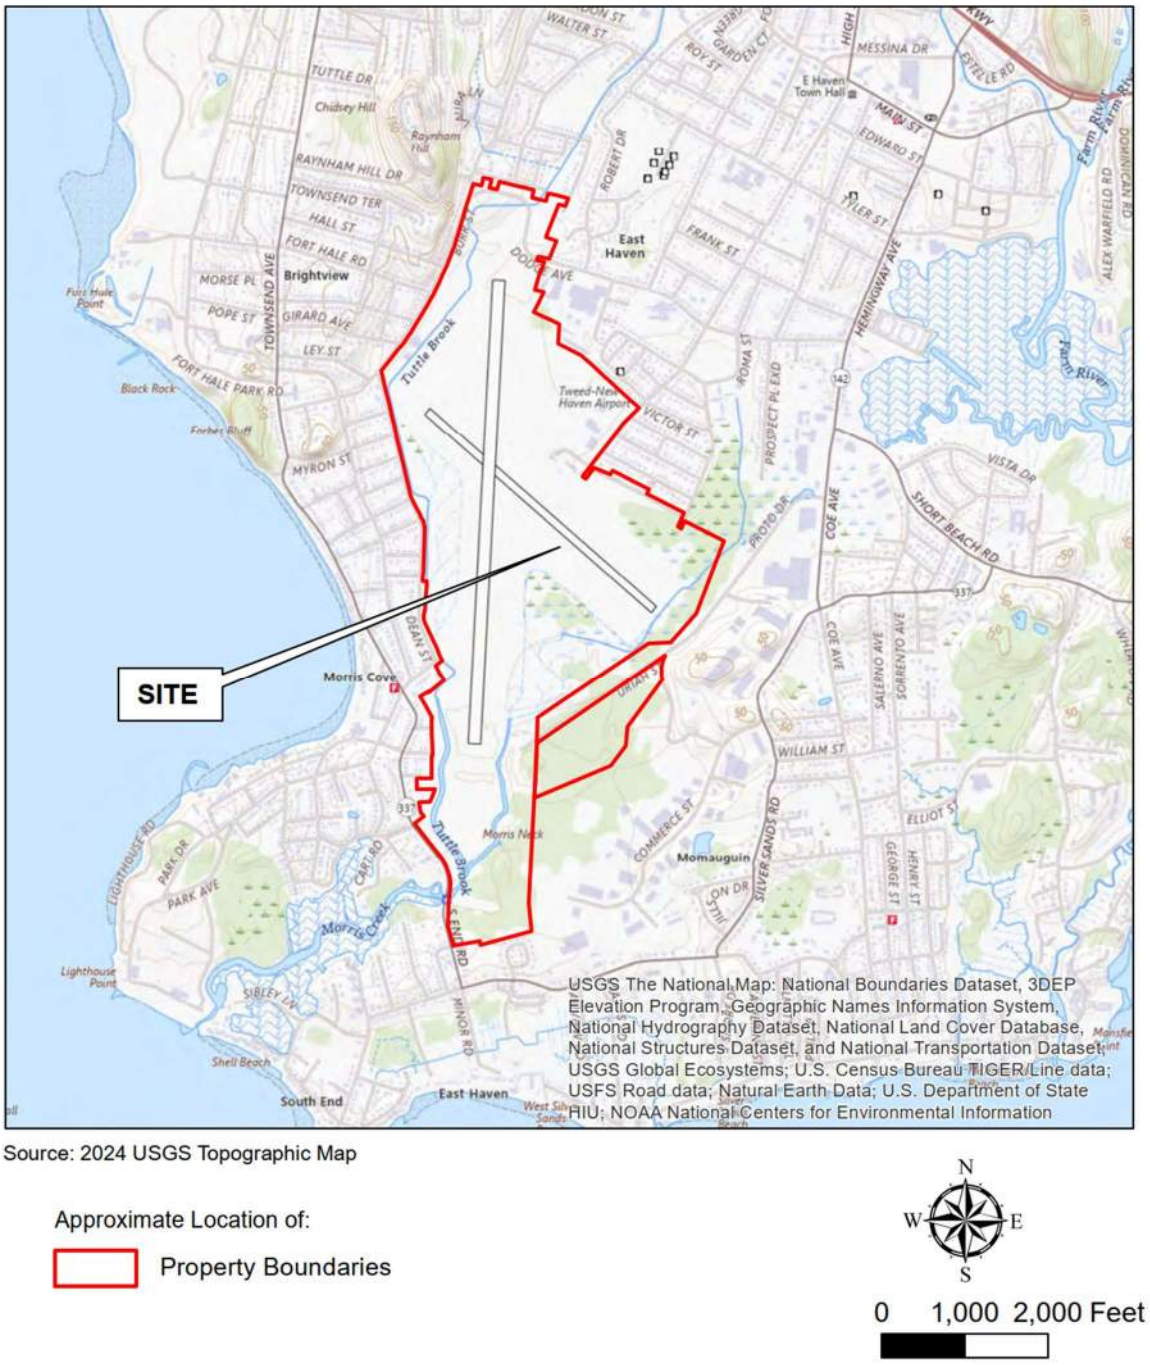

Figure 1 Proposed project location.

Additional elements associated with the East Terminal include associated roadways, parking lots, aprons and taxiways.

The **proposed runway improvements** (extension and drainage) include:

- Extension of Runway 02-20, which entails an approximate addition of 639 feet at the Runway 02 end and 336 feet at the Runway 20 end.
- Adjustment of runway cross-section and profile to be compliant with FAA standards.

- Strengthening of existing runway to meet pavement design requirements of the existing aircraft fleet.
- Incidental grading, stormwater drainage and markings.
- Adjustment of and calibration of navigation aids for both runway ends.
- Installation of runway edge lighting, guidance signs, and other accessory features to be compliant with FAA design standards.

The **proposed East Terminal development** includes:

- New East Terminal Building
    - Construction of a new terminal building ("East Terminal") on the east side of the Airport with an approximate gross square footage (SF) (functional area) of 80,000 SF, with four (4) aircraft gates and two (2) additional aircraft boarding positions (6 total, all ground boarding).
    - Installation/relocation of security fencing and vehicle access gate.
    - Incidental site work, including grading, installation of a stormwater management system and connection to existing on-site utilities such as electricity, water, wastewater, telephone and internet, and site work activities.

- New Apron at East Terminal
    - Construction of a new aircraft apron, with an area of approximately 450,000 SF, including ancillary site elements, would include two (2) Remain Overnight (RON) parking positions and six (6) gate parking positions.
    - Construction of two access taxilanes from the terminal apron to an extended Taxiway A.
    - Incidental site work, including deicing pads, blast deflector fence, grading, stormwater management system and utilities.
    - Removal of a FAA owned decommissioned very high frequency omni-directional range (VOR).

- New Vehicle Parking and Access Road
    - Construction of approximately 2,000 new parking spaces with an approximate footprint of 1,042,000 SF, including building support areas, to serve the new East Terminal.
    - Construction of a causeway and new two-lane (with potential to expand to four lane) airport access road from Proto Drive and associated improvements.
    - Installation of electrical lighting, wayfinding, signage, landscaping associated with new parking.
    - Incidental site work, including grading, stormwater management system and utilities.

The Proposed Project takes into consideration the Airport's location within the 100-year floodplain and incorporates resiliency measures, such as raising the finished floor elevation above the 100-year flood base flood elevation, placing key building mechanical systems in a raised mezzanine or on roof top locations where they will be above flood elevation, and site design considerations to promote drainage and increase flood resistance for site facilities.

The proposed East Terminal will be constructed on piers, raising the finished floor elevation above mean sea level. The space below the finished floor elevation will be left open to allow floodwater to pass. Additionally, the project will take place within the airport property and within an existing airport-dedicated easement. The new access road will connect with existing Proto Drive; therefore, limited construction would occur within public rights-of-way which mainly entails roads in the immediate vicinity of the Airport. No private property will be acquired as part of the Proposed Project.

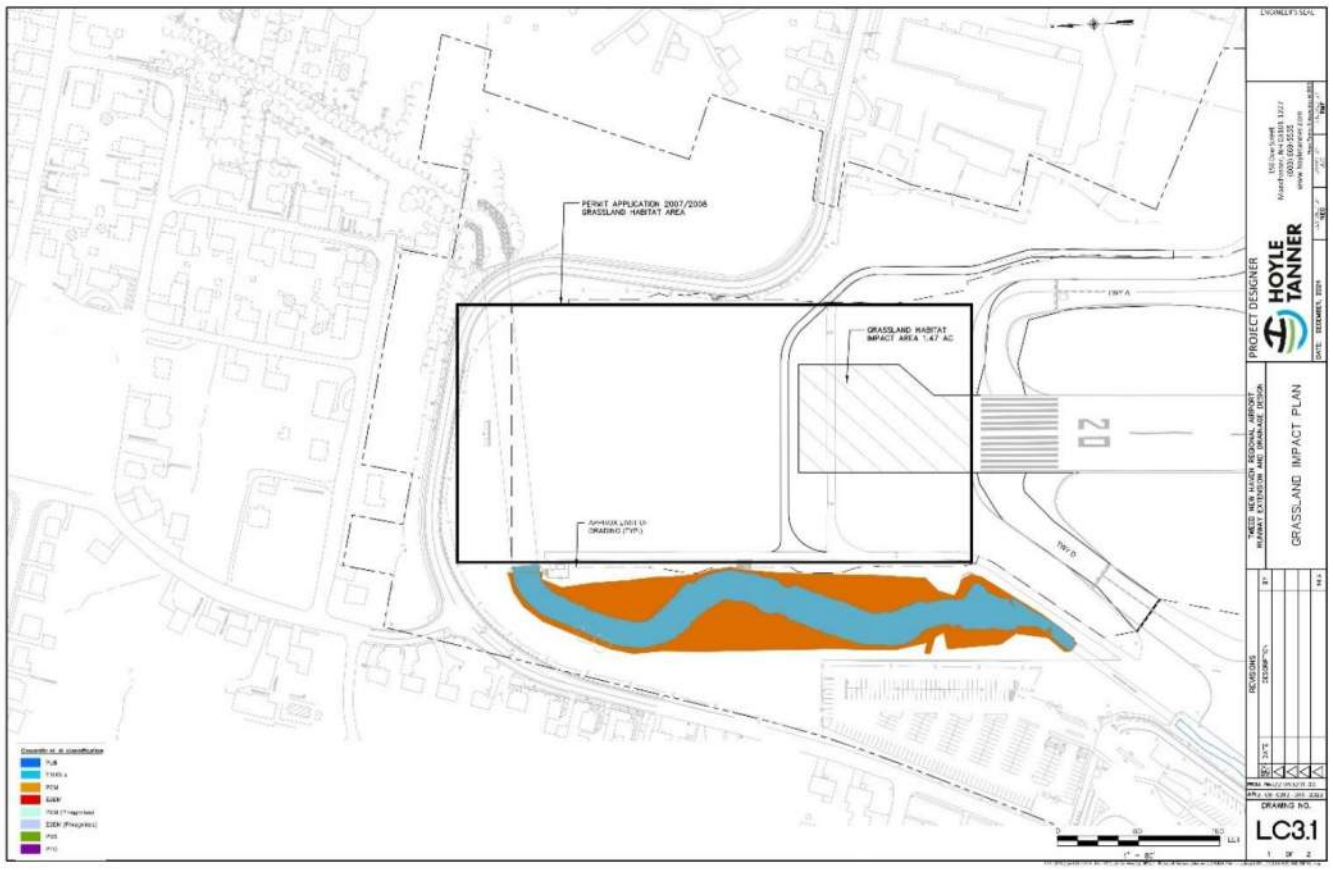

Figure 2 Proposed project impacts.

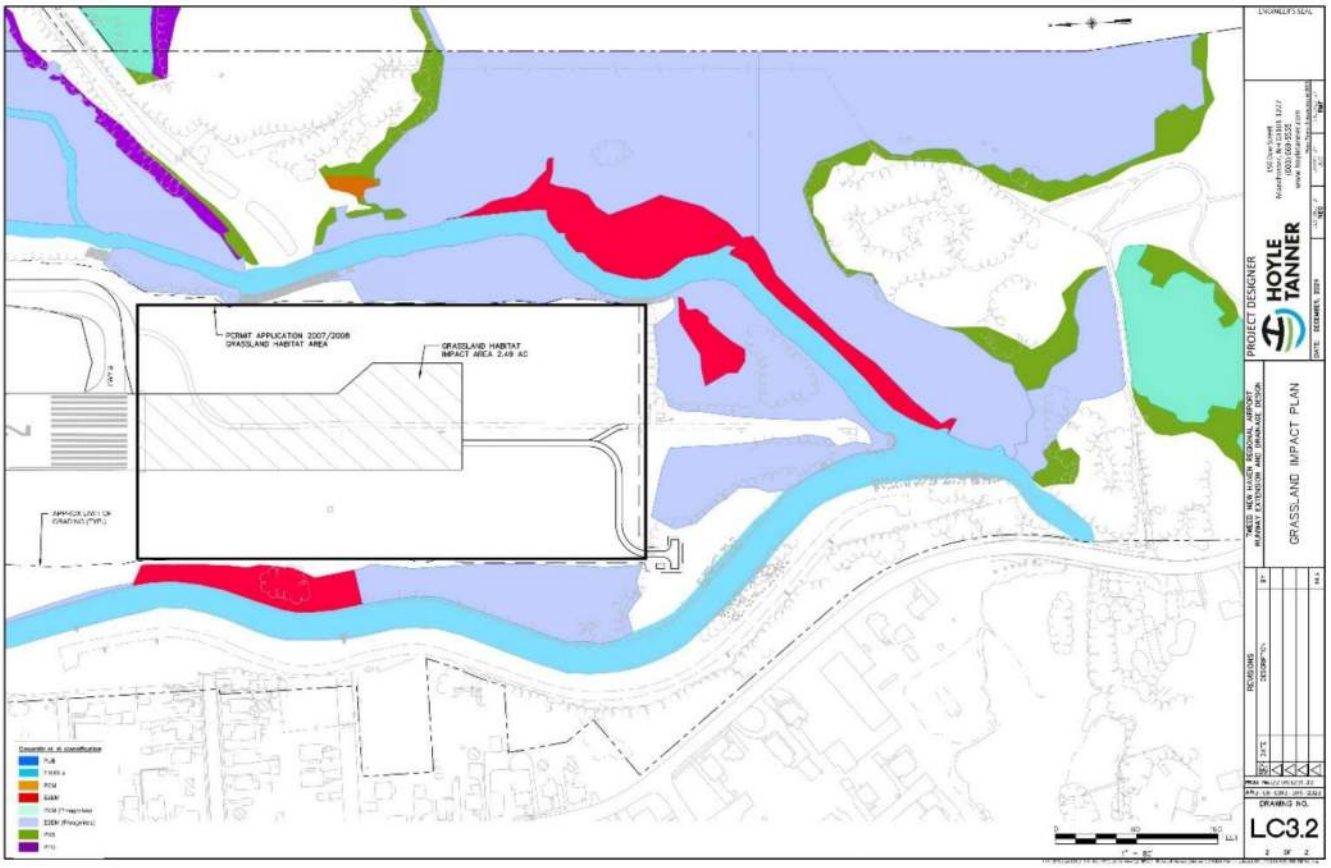

Figure 3 Proposed project impacts.

As a result of these activities, the Proposed Project will impact 3.96 acres of the 23-acre grassland bird habitat that was developed to address prior permit conditions (Figure 2 and Figure 3 Proposed project impacts).

3. Proposed Project Site

3.1 Regulatory Context

In 2007/2008 the TNHAA received permits from the CT Department of Energy and Environmental Protection (DEEP) for extension of the Runway 02-20 Safety Areas; Permits 200003049-KZ, IW-2000-116, DIV-200003052 and WQC-200003051 were issued for that project and contain specific conditions or reference to conditions that were included in plans provided at that time that addressed impacts to grassland bird habitat. Specifically, conditions included seeding disturbed lands with a mixture of warm seasonal grasses making up approximately 23 acres of new or enhanced grassland habitat, and submittal of a mowing plan for the 23 acres of grassland noted above. The area in question of 23 acres was intended to be comprised of the approximately 500'X1000' RW 2 Safety Area and the 500'X1000' RW 20 Safety Area.

A Grassland Management Plan (to serve as the mowing plan referenced above) was developed and submitted to CT DEEP in response to these permit conditions. The original plan was dated February 2008 and noted that the plan was developed to serve as a guideline for grassland management at the airport, but the goal of the plan has to remain in balance with the FAA's requirements, specifically FAA Advisory Circular 150/5200-33 *Hazardous Wildlife Attractants on or near Airports*. Notably, the 23-acre RSAs that were planted with warm season grasses were identified as being mowed between heights of 4-6 inches, to address FAA requirements.

Further coordination with FAA resulted in a supplement to that plan, dated April 2011 that was developed in response to the continued wildlife hazard issues that the airport was facing as documented in their Wildlife Hazard Management Plan. Specifically, areas that were initially identified as non-safety or non-critical areas that could be mowed once annually and not before September 1, were shifted to allow for mowing as needed to prevent seed growth and heights at which the grasses could be used for food or cover. This was in response to several wildlife hazard incidents, and it is crucial to future efforts that all parties recognize that the airport currently continues to follow this supplemented plan and mows all grassed areas as needed to keep grasses between 7"-14" to reduce the potential for grasses to attract wildlife, including grassland birds.

Coordination with CT DEEP Bureau of Natural Resources, Wildlife Division for the Proposed project (documented in Appendix A) was initiated by filing an NDDB Review. The response, Filing ID 107828, dated May 17 2024 identified the following grassland bird species:

- Grasshopper sparrow (*Ammodramus savannarum*) – State Endangered
- Horned lark (*Eremophila alpestris*) – State Endangered
- Eastern meadowlark (*Sturnella magna*) – State Threatened
- Bobolink (*Dolichonyx oryzivorus*) – State Special Concern
- Savannah sparrow (*Passerculus sandwichensis*) – State Special Concern

Follow-up coordination resulted in the investigation of an off-site location that could serve as grassland bird habitat mitigation. This site has prior recorded use by a species of special concern, brown thrasher (*Toxostoma rufum*) per communication with DEEP. The site was identified and is discussed further as the proposed mitigation site. DEEP has asked that a minimum of 25 acres be provided for offsite mitigation with the potential for more acreage if the habitat needs enhancement, part of the soils are excessively wet, or areas of the parcel are not favorable for nesting by this species for some other reason, and that documentation of current species use of the mitigation area will be factored into the minimum acreage proposals.

3.2 Proposed Project Site Description

The Proposed Project Site is located at the Tweed New Haven Airport (Airport) which is located on the boundary between the City of New Haven and the Town of East Haven, Connecticut. The Airport is situated approximately ¾-mile north of Long Island Sound, ¼-mile east of New Haven Harbor, and ¼-mile from Morris Cove. The Airport is a commercial service airport owned by the City of New Haven. TNHAA has full control of the operation and management of the airport, including land,

buildings and easements by virtue of a lease to the authority by the City of New Haven. On August 19, 2022, TNHAA entered into a long-term Lease & Development Agreement with The New HVN, LLC.

The Airport has been managed since 2009 to reduce wildlife hazards by mowing all grassland within the airport boundary to remain in balance with the FAA's requirements, specifically FAA Advisory Circular 150/5200-33 *Hazardous Wildlife Attractants on or near Airports.* Notably, this management includes the 23-acre area within the Runway Safety Areas (RSAs) that was planted with warm season grasses to serve as grassland bird habitat as a condition of prior permitting (see 3.1 Regulatory Context). As a result of these practices, the airport does not currently contain functional grassland bird habitat and does not intend to manage grassland on the airport for grassland birds in order to maintain safe conditions for aviation use as is the intended purpose of an airport.

3.3 Species surveys

As recommended by CT DEEP NDDB in the request for additional information Filing ID 107828 for the proposed project, a survey of grassland bird use was conducted at the Airport in 2024 (Appendix B). Only a single state-listed species, savannah sparrow (*Passerculus sandwichensis*), was observed using the airport habitats.

The Wildlife Hazard Assessment conducted in 2007 through 2008 for the permits required for the Runway 02-20 RSA extensions documented savannah sparrow, horned lark and eastern meadowlark. No other wildlife or bird surveys have been conducted between those surveys and the survey conducted in 2024. The reduction in grassland bird species diversity is reflective of the change in management of grassland within the airport.

4. Grassland Mitigation

4.1 Mitigation Site Introduction

The Warren Property, located in Eastford, Connecticut, along Bungee Brook, is the proposed mitigation site for grassland bird habitat. This approximately 76-acre parcel in Windham County comprises a mix of grassland and forested habitats and is currently managed for agricultural uses, including hay production, corn cultivation, and maple syrup harvesting. A key ecological feature of the property is Bungee Brook and its associated floodplain, which traverse the site, enhancing habitat connectivity and providing critical resources for wildlife.

Figure 4 Warren Property site.

The property includes over 25 acres of open habitat comprising of grassland fields and low-vegetation areas that support documented populations of Connecticut-listed special concern grassland birds and other threatened and endangered species. The Warren Property's proximity to existing protected lands further enhances its potential to contribute to a larger, contiguous landscape for grassland species.

Strong local support from the environmental community highlights the importance of preserving this unique site. Additionally, Joshua's Trust, a highly knowledgeable and dedicated local conservation organization, has committed to participating in the long-term success of the project with financial support coming from The New HVN, LLC.

4.2 Existing Conditions of the Mitigation Site

The existing conditions of the Warren Property (mitigation site) have been recorded by ornithologists, biologists, and herpetologists in numerous reports and site visits. Additionally, the mitigation site conditions are documented in publicly available databases and surveys. The sections below summarize the existing soils, vegetation, and observed wildlife species for the mitigation site.

4.2.1 Existing soils

Mitigation site soils are of two origins. The first is Pleistocene glaciofluvial sands and gravels carried by glacial melt water that are well drained to the point of being droughty. The second is Holocene

alluvial sediment associated with the floodplain of Bungee Brook. According to the USDA[1], UCONN[2], and CTDEEP[3] the soils represented are as follows (refer to Figure 5 Soil map units for the mitigation site):

- 23A Sudbury Sandy Loam. Moderately well drained; very strongly to moderately acidic;
- 36A Windsor Sandy loam. Excessively drained; very strongly to mildly acidic.
- 38 A; 38 C Hinckley Gravelly sandy loam. Excessively drained; extremely to moderately acidic;
- 60C Canton-Charlton Soils. Gravelly and/or sandy loams; excessively to moderately drained; excessively to moderately acidic;
- 84B Paxton and Montauk Fine Sand Loam. Well drained; very strongly to moderately acidic;
- 102 Pootatuck Fine Sandy Loam. Moderately well drained; very strongly to moderately acidic; and
- 108 Saco Silt Loam. Very poorly drained; very strongly acidic to neutral.

The dominant condition of very well drained, acidic soil is propitious for the management of grassland due to the xeric moisture regime, acidic soil interfering with nutrient availability, and the tendency of sandy soil to leach nitrogen. However, maintaining grassland in the northeastern US requires continued management due to average precipitation supporting the establishment of forest canopy. Existing site conditions of low moisture, low pH, and low nitrogen as nitrate make the continued management of herbaceous plant cover less onerous.

Existing grassland soil conditions at the airport project site are listed by the CT.gov GIS data as Udorthents-Urban land complex soils. This soil type is generally well-draining, level or gently sloping, and typically indicative of areas where original soils have been removed or covered with loamy fill material. Such soil conditions are well-suited for grassland species due to their dry and well-draining substrate.[4]

The soils at the mitigation site share many similarities with the airport's Udorthents-Urban land complex soils in their suitability for supporting grassland habitat. The mitigation site's predominant soil types such as Sudbury Sandy Loam, Windsor Sandy Loam, Hinckley Gravelly Sandy Loam, and Paxton and Montauk Fine Sandy Loam, are well to excessively drained, with sandy or gravelly textures that promote good drainage—key characteristics for grassland establishment. While some areas, such as those with Saco Silt Loam, are poorly drained, the majority of the mitigation site's soils align closely with the well-draining conditions found at the airport, making them equally conducive to creating and maintaining grassland habitat.

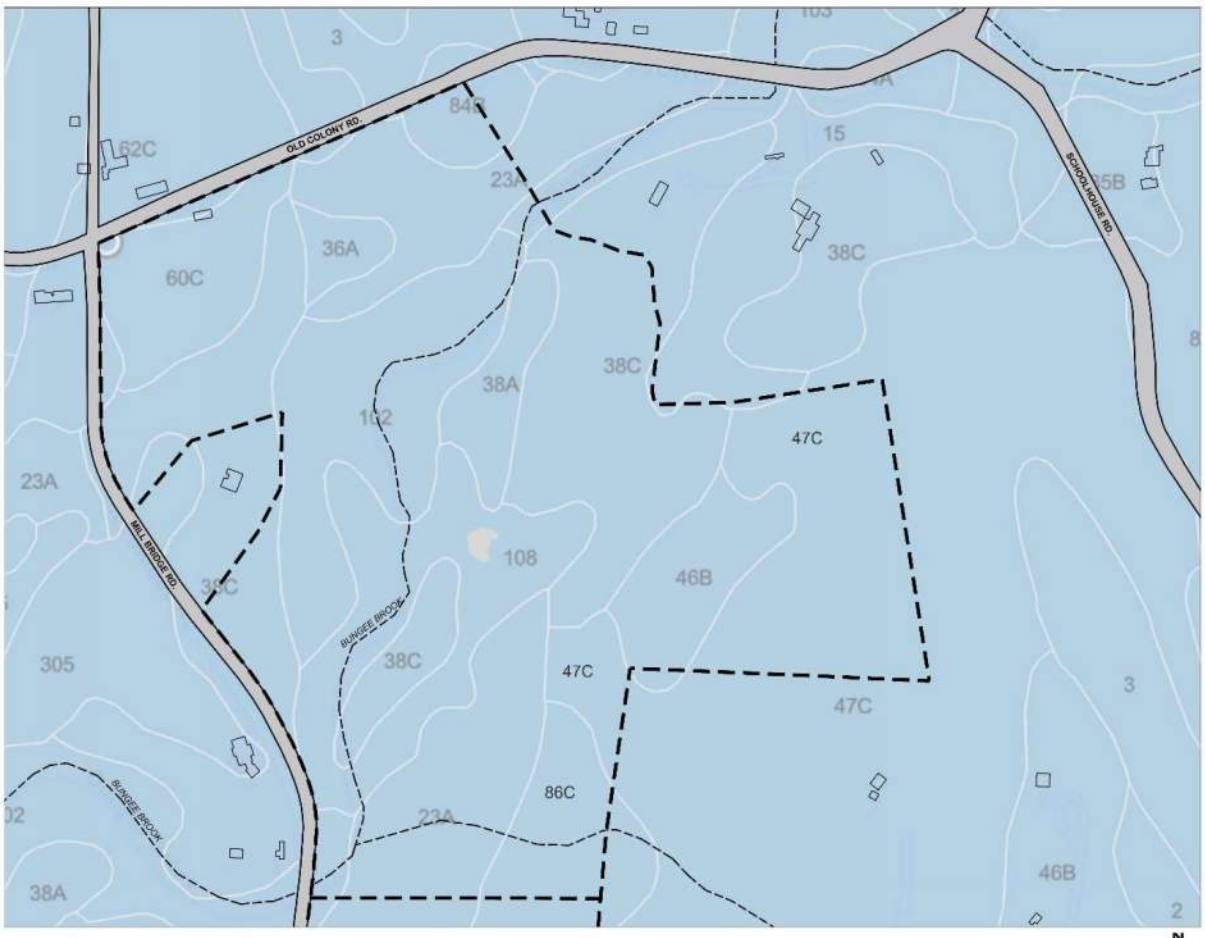
[4] (BSC Group, December 6, 2024)



Soil Map Unit Symbol	Soil Map Unit Name
60C	Canton and Charlton fine sandy loams, 8 to 15 percent slopes
36A	Windsor loamy sand, 0 to 3 percent slopes
84B	Paxton and Montauk fine sandy loams, 3 to 8 percent slopes
23A	Sudbury sandy loam, 0 to 5 percent slopes
38C	Hinckley loamy sand, 3 to 15 percent slopes
102	Pootatuck fine sandy loam
38A	Hinckley loamy sand, 0 to 3 percent slopes
108	Saco silt loam, frequently ponded, 0 to 2 percent slopes, frequently flooded
46B	Woodbridge fine sandy loam, 0 to 8 percent slopes, very stony
47C	Woodbridge fine sandy loam, 3 to 15 percent slopes, extremely stony
86C	Paxton and Montauk fine sandy loams, 3 to 15 percent slopes, extremely stony

Figure 5 Soil map units for the mitigation site.

4.2.2 Vegetation

eDesign Dynamics visited the mitigation site on October 18, 2024, for a preliminary site and vegetation rapid assessment. The eDesign Dynamics team consisted of ornithologist Michael Feller and ecologist Eric Rothstein. At the time of the site assessment the larger vegetation matrix was a mowed pasture/grasslands and cornfield. Other plant community associations observed are as follows:

- Bungee Brook Floodplain

Alnus sp. (alder)
Asclepius incarnata (swamp milkweed)
Bohemeria cylindrica (stinging nettle)
Cornus sericea (grey dogwood)
Dicanthelium clandestinum (deer tongue)
Eutrichium sp. (Joe Pye weed)
Polygonum acerifolium (tear thumb)
Salix nigra (black willow)
Scirpus cyperinus (woolgrass)

- Hedgerow Thicket
  Celastrus orbiculatus (Asiatic bittersweet)
  Prunus serotinum (black cherry)
  Pytolacca americana (pokeweed)
  Rubus sp. (raspberry bramble)

- Shelter Belt at Eastern Edge of Property
  Clematis sp. (clematis)
  Cornus sericea (grey dogwood)
  Euonymous elatus (burning bush)
  Malus sp. (crab apple)
  Rosa multiflora (multiflora rose)
  Sambucus canadensis (elderberry)

- Shrub Swamp
  Alnus sp. (alder)
  Lonicera cf. tartarica (Tartarian honeysuckle)
  Salix sp. (willow)

- Vegetated Swale
  Populus tremuloides (quaking aspen)
  Rosa multiflora (multiflora rose)
  Thelypterus palustris (marsh fern)
  Typha latifolia (cattail)

- Vegetated Buffer along Old Colony Road
  Acer rubrum (red maple)
  Acer saccharum (sugar maple)
  Celastrus orbiculatus (Asiatic bittersweet)
  Eleagnus umbellatus (autumn olive)
  Euonymous elatus (burning bush)
  Euthamia sp. (flat-topped goldenrod)
  Populus deltoides (eastern cottonwood)
  Solidago sp. (goldenrod)

In addition to the vegetation listed above, the site includes a steep woody slope on the northwest and west the easternmost field. At its northern extent, the forest canopy is formed from mature mixed oaks. The stature of the trees decreases and species composition changes to include more black cherry and white pine.

Over 25 acres of open habitat comprised of grassland fields and low-vegetation areas exist on the property with two large contiguous areas bisected by the Bungee Brook floodplain. Research suggests that the existing floodplain between the two habitat patches may be facultative and provide better habitat for grassland birds than a grassland of equal size and shape that is adjacent to a forest[5].

4.2.3 Documented species

Several species inventories have been conducted at the mitigation site including both herpetology assessments and bird surveys. The Natural Diversity Database (NDDB) indicates that the wood turtle, American kestrel, and brook floater, all species of special concern, have been documented within or close to the Property. In addition, CT DEEP's NDDB Wildlife Biologist noted that the brown thrasher (*Toxostoma rufum)*, a CT-listed Species of Special Concern, has been documented at the site (see Appendix A Regulatory Communication).

On August 8, 2024, professor of conservation biology at the University of Connecticut, Chris Elphick, visited the Property and observed several bird species.[6] The species included Species of Special Concern, bobolink. Several bobolinks were seen on site including at least one female acting in an agitated manner, indicating the bird had a nest in the field. Dr. Elphick also noted that the site is also suitable for other state-listed bird species (American kestrel, alder flycatcher, brown thrasher), some of which have been reported on the Property.

Bryan Avery, land protection manager at Joshua's Trust, and Andy Rzeznikiewicz, land manager for the Audubon Pomfret Center observed several bird species while onsite during June 5, 2024. The species include:

CT State Listed Species:

- *Dolichonyx oryzivorus* (bobolink), Species of Special Concern
- *Empidonax alnorum* (alder flycatcher), Species of Special Concern
- *Progne subis* (purple martin), Species of Special Concern
- *Toxostoma rufum* (brown thrasher), Species of Special Concern

Other Species:

- *Agelaius phoeniceus* (red-winged blackbird)
- *Anas platyrhynchos* (mallard)
- *Archilochus colubris* (ruby-throated hummingbird)

[5] (Cadenasso, Pickett, Weathers, & Jones, 2003)
[6] (Chris Elphick, August 2024) see also Appendix D.

- *Ardea herodias* (great blue heron)
- *Baeolophus bicolor* (tufted titmouse)
- *Bombycilla cedrorum* (cedar waxwing)
- *Buteo jamaicensis* (red-tailed hawk)
- *Cardinalis cardinalis* (northern cardinal)
- *Catharus fuscescens* (veery)
- *Cathartes aura* (turkey vulture)
- *Certhia americana* (brown creeper)
- *Colaptes auratus* (northern flicker)
- *Contopus virens* (eastern wood-pewee)
- *Coragyps atratus* (black vulture)
- *Corvus brachyrhynchos* (American crow)
- *Corvus corax* (common raven)
- *Cyanocitta cristata* (blue jay)
- *Dryobates pubescens* (downy woodpecker)
- *Dumetella carolinensis* (gray catbird)
- *Empidonax minimus* (least flycatcher)
- *Empidonax traillii* (willow flycatcher)
- *Geothlypis trichas* (common yellowthroat)
- *Haemorhous mexicanus* (house finch)
- *Hirundo rustica* (barn swallow)
- *Hylocichla mustelina* (wood thrush)
- *Icterus galbula* (Baltimore oriole)
- *Icterus spurius* (orchard oriole)
- *Megaceryle alcyon* (belted kingfisher)
- *Melanerpes carolinus* (red-bellied woodpecker)
- *Meleagris gallopavo* (wild turkey)
- *Melospiza melodia* (song sparrow)
- *Mniotilta varia* (black-and-white warbler)
- *Molothrus ater* (brown-headed cowbird)
- *Myiarchus crinitus* (great crested flycatcher)
- *Parkesia motacilla* (Louisiana waterthrush)
- *Passerina cyanea* (indigo bunting)
- *Pheucticus ludovicianus* (rose-breasted grosbeak)
- *Piranga olivacea* (scarlet tanager)
- *Poecile atricapillus* (black-capped chickadee)
- *Quiscalus quiscula* (common grackle)
- *Sayornis phoebe* (eastern phoebe)
- *Seiurus aurocapilla* (ovenbird)
- *Setophaga petechia* (yellow warbler)
- *Sialia sialis* (eastern bluebird)
- *Sitta carolinensis* (white-breasted nuthatch)

- *Spinus tristis* (American goldfinch)
- *Spizella passerina* (chipping sparrow)
- *Stelgidopteryx serripennis* (northern rough-winged swallow)
- *Sturnus vulgaris* (European starling)
- *Tachycineta bicolor* (tree swallow)
- *Troglodytes aedon* (house wren)
- *Turdus migratorius* (American robin)
- *Tyrannus tyrannus* (eastern kingbird)
- *Vireo flavifrons* (yellow-throated vireo)
- *Vireo gilvus* (warbling vireo)
- *Vireo olivaceus* (red-eyed vireo)
- *Zenaida macroura* (mourning dove)

During eDesign Dynamics' October 18, 2024 visit to the mitigation site the team observed and recorded several bird species, including savannah sparrow (see Figure 6). The following species were observed onsite during this visit:

CT State Listed Species:

- *Passerculus sandwichensis* (savannah sparrow), Species of Special Concern

Other Species:

- *Agelaius phoeniceus* (red-winged blackbird)
- *Buteo jamaicensis* (red-tailed hawk)
- *Cardinalis cardinalis* (northern cardinal)
- *Cathartes aura* (turkey vulture)
- *Circus hudsonius (*northern harrier*)*
- *Colaptes auratus* (northern flicker)
- *Corvus brachyrhynchos* (American crow)
- *Corvus corax* (common raven)
- *Junco hyemalis* (dark-eyed junco)
- *Lanius borealis* (northern shrike)
- *Melospiza melodia* (song sparrow)
- *Sialia sialis* (eastern bluebird)
- *Sturnus vulgaris* (European starling)

Figure 6 Picture of a savannah sparrow at the mitigation site, photographed Oct 18, 2024.

On May 24, 2024, herpetologist Hank J. Gruner assessed the mitigation site's potential to support amphibian and reptile species of conservation importance. While the focus of the assessment[7] was on herpetofauna, the findings underscore the broader ecological importance of the mitigation site highlighting its role in supporting a diverse array of species and contributing to regional biodiversity. The assessment documented species with occurrences categorized as "Confirmed," "Probable," or "Possible." Confirmed species were directly observed during the site walk, while probable occurrences indicate suitable habitat and widespread regional distribution. Possible occurrences suggest the presence of suitable habitat, though the species has a more restricted distribution in the area. The following list of species were observed or documented at the mitigation site, according to the Herpetological Assessment (see Appendix C).

Amphibians

- Confirmed:
    - *Lithobates catesbeianus* (American bullfrog)
    - *Lithobates clamitans* (green frog)
    - *Lithobates sylvaticus* (wood frog)
- Probable:
    - *Ambystoma maculatum* (spotted salamander)
    - *Anaxyrus americanus* (American toad)
    - *Desmognathus fuscus* (northern dusky salamander)
    - *Dryophytes versicolor* (gray treefrog)
    - *Eurycea bislineata* (northern two-lined salamander)
    - *Lithobates palustris* (pickerel frog)

[7] (Gruner, July 2024) see also Appendix C

    - *Pseudacris crucifer* (spring peeper)
- Possible:
    - *Ambystoma opacum* (marbled salamander)
    - *Anaxyrus fowleri* (Fowler's toad)
    - *Hemidactylium scutatum* (four-toed salamander)
    - *Notophthalmus viridescens* (red-spotted newt)

Reptiles

- Confirmed:
    - *Chrysemys picta* (painted turtle)
    - *Thamnophis sirtalis* (eastern gartersnake)
- Probable:
    - *Chelydra serpentina* (snapping turtle)
    - *Clemmys guttata* (spotted turtle)
    - *Diadophis punctatus* (northern ring-necked snake)
    - *Glyptemys insculpta* (wood turtle)
    - *Nerodia sipedon* (northern watersnake)
    - *Sternotherus odoratus* (eastern musk turtle)
    - *Storeria dekayi* (DeKay's brownsnake)
    - *Storeria occipitomaculata* (red-bellied snake)
- Possible:
    - *Carphophis amoenus* (eastern wormsnake)
    - *Coluber constrictor* (northern black racer)
    - *Heterodon platirhinos* (eastern hog-nosed snake)
    - *Lampropeltis triangulum* (eastern milksnake)
    - *Opheodrys vernalis* (smooth greensnake)
    - *Terrapene carolina* (eastern box turtle)
    - *Thamnophis saurita* (ribbonsnake)

In addition, a bird species assessment was performed by Davison Environmental for a proposed solar facility at 254 Putnam Road, Pomfret Center, Connecticut, located approximately 7 miles east of the mitigation site.[8] The assessment serves as a reference landscape for the mitigation site and includes habitat evaluations and bird surveys to document the presence and potential habitat suitability for various grassland and wetland bird species, providing insights into regional avian populations and their conservation needs. According to the assessment, "[c]onfirmation of the presence of two of these species [State-listed bird species] within the project area, bobolink and savannah sparrow, were made in May 2021 during grassland bird surveys." The following is a table of state-listed bird species recorded on or near the 254 Putnam Road site during May of 2021.

[8] (Davison Environmental, 2021)

Table 1 State-listed bird species recorded at or near 254 Putnam Road.

Scientific Name	Common Name	NDDB Status	Status	Preferred Habitat	Recorded Location(s)
Asio flammeus	short-eared owl	T	Winter roost/forage	Grassland	Duck Marsh, 254 Putnam Rd
Asio otus	long-eared owl	E	Winter roost/forage	Grassland	Duck Marsh, 254 Putnam Rd
Botaurus lentiginosus	American bittern	E	Confirmed Breeding	Wetlands	Duck Marsh
Circus hudsonius	northern harrier	E	Possible Breeding	Grassland	Duck Marsh, 254 Putnam Rd
Cistothorus platensis	sedge wren	E	Confirmed Breeding	Wetlands	Duck Marsh
Dolichonyx oryzivorus	bobolink	SC	Confirmed Breeding	Grassland	Duck Marsh, 254 Putnam Rd
Falco sparverius	American kestrel	SC	Confirmed Breeding	Grassland	Duck Marsh
Passerculus sandwichensis	savannah sparrow	SC	Confirmed Breeding	Grassland	Duck Marsh, 254 Putnam Rd
Podilymbus podiceps	pied-billed grebe	E	Confirmed Breeding	Open water	Duck Marsh
Progne subis	purple martin	SC	Unknown	Nest Boxes	Unknown

4.3 Suitability of the Mitigation Site

The mitigation site is a highly suitable site for conservation for grassland bird habitat due to its ecological characteristics, alignment with established habitat preferences, documented species presence, and exceptional management potential. The significance of this property centers on its ability to support state-listed species, its scarcity as a protected grassland habitat in the region, and its suitability for a wide variety of grassland bird species, including savannah sparrows, bobolinks, and potentially eastern meadowlarks.

The proposed mitigation site is uniquely suited for this project as the land will be preserved in perpetuity and managed as an early successional grassland. Additionally, agricultural production on the site will cease upon commencement of the mitigation, allowing the land to fully transition to its intended ecological function. The Warren family's dedication to conservation, in partnership with Joshua's Trust, underscores their shared commitment to safeguarding this critical ecological resource in Connecticut. Refer to the Financial Assurances & Responsible Parties (Section 5) for additional information on the ownership and stewardship of the land.

4.3.1 Documented species preference

Connecticut-listed special concern grassland bird species have been documented on the mitigation site. Dr. Chris Elphick noted the site's suitability for additional state-listed species such as American kestrel, alder flycatcher, and brown thrasher, as well as its potential to attract nesting eastern meadowlarks. The latter species is one of the rarest nesting birds in Connecticut, confirmed at only five sites statewide during the four-year Connecticut Bird Atlas survey.

As noted in previous sections, additional on-site surveys have documented a number of grassland birds that are currently utilizing the site, including savannah sparrow. The documented presence of species underscores the ecological importance of the mitigation site for grassland bird conservation. The potential to attract additional state-listed species, such as the rare eastern meadowlark, highlights the site's critical role in supporting regional biodiversity. Targeted management practices, including habitat enhancements and mowing in perpetuity, will further promote the suitability of this area for both existing and potential grassland bird populations.

4.3.2 Habitat preferences

The site's grassland features align closely with the habitat preferences of savannah sparrows. According to Fisher and Davis, grassland bird habitat quality is strongly influenced by bare ground, litter depth, and vegetation height.[9] The current agricultural practices at the mitigation site including hay production, maintain these conditions by supporting areas of bare ground, managing litter accumulation, and ensuring medium vegetation height—critical for nesting and foraging. Future management practices will further enhance the grassland's suitability for a wide range of nesting and foraging species as mowing will be conducted in late fall, outside of nesting windows, using a rotational strategy to maximize species diversity while preventing woody encroachment.

Savannah sparrows are well-documented as thriving in such mesic environments, characterized by moderate moisture and medium vegetation height, which are typical of hayfields, idle fields, and lightly grazed pastures. Additionally, studies by Wiens[10] and Rottenbury and Wiens[11] highlight the importance of forb cover, a feature present in the mitigation site's diverse vegetated habitats. These factors make the site an ideal location for supporting savannah sparrow populations alongside other grassland bird species.

These ecological features support the site's role as a rare and vital habitat in a region where protected grasslands are scarce. Moreover, its connectivity to adjacent habitats and proximity to protected lands, including the Natchaug State Forest, further increases its conservation importance by reducing edge effects and supporting species movement across the landscape.

In addition to its value for grassland birds, the site's mix of wet meadow and shrubby edge habitats provides resources for a broader array of plant and wildlife species, further enhancing its ecological importance and benefits of preservation. For example, while savannah sparrows thrive in grassland areas, brown thrashers rely on brushy thickets and hedgerows along field edges for nesting and cover. This enhances overall biodiversity, providing essential resources for multiple species and reinforcing the importance of a balanced management approach.

4.3.3 Pre-enhancement bird survey

Before implementing any habitat enhancement activities, an ornithologist will conduct a bird survey at the mitigation site during the savannah sparrow breeding season to confirm that the site is

[9] (Fisher & Davis, 2010)
[10] (Wiens, 1973)
[11] (John T. Rotenberry, 1980)

utilized by savannah sparrows, meets their habitat requirements, and assess if the site could benefit from habitat enhancement measures.

The following bird survey methodology was informed by CT DEEP's methodology for the grassland bird survey prescribed for the project site located at the Tweed New Haven Airport. Refer to the CT DEEP Grassland Bird Habitat Conceptual Plan dated April 8, 2024, included within the Appendix A Regulatory Communication.

- Ornithologist to conduct three visits during the breeding season; savannah sparrow breeding season informed by the Connecticut Bird Atlas as May 10 through August 1st.[12]
- For standard grassland point count surveys, each point location consists of a 100-meter radius plot centered on the observation point with a minimum distance of 250 meters between observation points. Points will be identified through a desktop evaluation of the survey area and GPS located in the field. All birds seen/heard within approximately 100 meters of a point are recorded, and birds observed beyond 100 meters from a point while traveling between points are also recorded. Surveys are to be conducted between a half hour before sunrise and 9:00 AM. Surveys shall not be conducted during inclement weather, including precipitation, fog, or strong winds (i.e., greater than 10-12mph). Point counts are conducted for five minutes after an initial 1-2 minutes of silence after arriving at the point to allow birds to recover from any disturbance. Data recorded for each survey point includes date; surveyor name; point number; start and end time; and weather information (temperature, wind speed and direction, precipitation and cloud cover), species observed, number of individuals per species, and behavior (carrying food, flying, perching, singing, displaying, etc.). Surveys must be conducted by personnel able to identify CT grassland birds in the field by song and by sight.

Within one month of conducting the bird survey, the results of the bird surveys, including data on species observed, behaviors, and environmental conditions, will be compiled by the ornithologist and submitted to DEEP for review to confirm suitability of habitat enhancement measures.

4.3.4 Follow-up bird survey

To assess the effectiveness of the habitat mitigation efforts and ensure the sustained support of grassland bird populations, annual follow-up bird surveys will be conducted beginning in spring 2028, following two full mowing/growing seasons after the initiation of mitigation work and adaptive management. These surveys will continue through the duration of the five-year mitigation plan to monitor grassland bird usage and habitat conditions. Survey results will be compiled and submitted to the Connecticut DEEP Natural Diversity Database (NDDB) no later than August 31 each year, allowing sufficient time for NDDB review and feedback before the implementation of adaptive management activities in the late fall.

4.4 Mitigation Overview

The mitigation site offers a significant opportunity to preserve and enhance grassland habitat, supporting declining populations of grassland bird species such as the savannah sparrow.

[12] (UCONN, 2024)

According to the Northeast Upland Habitat Technical Committee, "[w]ildlife species adapted to grassland landscapes are now diminishing as farmlands are left idle and revert to forests or are replaced by housing and commercial development." [13] To address the natural tendency of northeastern grasslands to revert to forests, annual mowing will be implemented in perpetuity to prevent the encroachment of woody trees and shrubs.

The site selected for this mitigation project includes former corn and hay fields that will be enhanced, managed, and permanently preserved as grassland habitat. With the cessation of agricultural activities, the site will transition into an early successional grassland landscape.

The proposed mitigation includes:

- Habitat Enhancement and Adaptive Management: Enhancement will include reseeding fields with a diverse mix of native forbs and grasses, tailored to the nesting and foraging needs of savannah sparrow. In addition, invasive or undesirable woody vegetation will be removed selectively to create shrub patches and transitional habitat zones that blend the habitat structure of grassland and shrubland plant communities. Adaptive management over a 5-year period will help to ensure the success of the enhancement.
- Long-Term Preservation and Management: Over 25 acres of open habitat comprising of grassland fields and low-vegetation areas will be permanently protected, providing essential habitat for grassland-dependent species like the savannah sparrow. Management will include annual rotational mowing (which includes mowing one-third of the fields each year) to maintain the open landscape and prevent natural succession to forest.

The proposed mitigation offers significant added value by supporting a broader range of species that depend on grassland and adjacent habitats. Enhancing the grassland will benefit wood turtles by maintaining open, low-vegetation areas critical for basking and nesting. The American kestrel, a species reliant on open fields for hunting, will find improved foraging opportunities in the enhanced habitat. The strategic retention of shrub patches, hedgerows, and thickets along field edges will preserve nesting habitat for the brown thrasher. Bobolinks and potentially nesting eastern meadowlarks, both grassland obligate species, will benefit from the increased availability of high-quality nesting sites and food resources provided by the reintroduction of native wildflowers and grasses. Collectively, these efforts contribute to the conservation of a diverse suite of species while enriching the ecological value of the site.

The grassland mitigation is a commitment to safeguarding the delicate balance of an early-successional habitat. By preventing woody plant encroachment and preserving the continuity of open grasslands, this mitigation works to create a sanctuary for grassland-dependent species.

4.5 Mitigation Research

The proposed mitigation is informed by research and background information for the mitigation site gleaned from several grassland management experts and sources.

Some key research findings include the following.

[13] (The Northeast Upland Habitat Technical Committee, 2006)

Grassland Bird Habitat Needs

- Chris Elphick, PhD (UConn Conservation Biology):[14]
  Eastern meadowlarks and bobolinks require large, contiguous patches of open grasslands. Proper timing of grass cutting and tree removal presents an opportunity to enhance habitat for these species, which serve as representatives of Connecticut's grassland bird community, including savannah sparrows.

- Swanson et al.:[15]
  Savannah sparrows and other grassland birds benefit from a mosaic of successional stages. Rotational treatments like burning, grazing, mowing, or disking are essential for creating and maintaining these mosaics.
  Keys to management: Extensive grasslands of intermediate height, well-developed litter layers, controlled succession, and protection of nesting habitats during breeding seasons.

Landscape Considerations

- Grassland birds are area-sensitive, requiring habitats above a minimum size threshold with a low edge-to-interior ratio. Studies (e.g., Fletcher and Koford,[16] Gieselman[17]) indicate that grasslands within 25-30 meters of edge habitats are less suitable for nesting due to increased predation and habitat disruption.

- Gruner:[18]
  If the primary management goal for the property is wildlife, including wood turtles, mowing should only take place between October 15-March 15, outside of the activity season (March 15-October 15). This will help to prevent inadvertent injury or mortality of individual wood turtles from mowing.

Practical Management Recommendations

- Audubon New York:[19]
  Remove woody vegetation and brush lines to reduce predation risks and improve habitat connectivity.
  Employ a rotational mowing strategy to maintain healthy grasslands, such as mowing one-third or one-half of the area each year.
  Use spot-mowing and other targeted controls to manage invasive species effectively.

Savannah Sparrow Dietary Needs

- Cornell Lab, *Birds of the World*:[20]
  During the breeding season, savannah sparrows rely heavily on insects, including beetles,

[14] (Chris Elphick, August 2024) see also Appendix D
[15] (David A. Swanson, May 2023)
[16] (Robert J. Fletcher, October 2022)
[17] (Tanis M. Gieselman, 2013)
[18] (Gruner, July 2024) see also Appendix C
[19] (Audubon New York , 2024)
[20] (Audubon New York , 2024)

flies, and caterpillars, supplemented by seeds early in the season when insect availability is low.

Based on these findings, the following strategies are incorporated within the mitigation to address the specific needs of grassland-dependent species while promoting habitat resilience:

- Implement Rotational Management: A rotational mowing strategy of mowing one-third of the grasslands annually (i.e., mow one-third of the grasslands one year, one-third the following year, and the remaining one-third the following year, and repeating this cycle) will be followed. This strategy supports habitat needs for savannah sparrow and other grassland species, promoting biodiversity and ecological balance.
- Strategically Timed Mowing: The mowing will occur in the late fall to avoid disturbance during sensitive breeding and nesting periods for wildlife.
- Prevent Woody Encroachment: Targeted removals of invasive vegetation, particularly along grassland edges, will be removed to increase the size and contiguity of the grassland while reducing edge effects that negatively impact grassland bird habitat.
- Enhance Grassland Habitat: Grassland fields will be overseeded with a native forb and grassland mix to improve diversity, provide essential food resources, and create optimal nesting conditions.

It is important to note that habitat management supporting the savannah sparrow will be carefully designed to avoid negatively impacting any other species, including the brown thrasher and American kestrel. Management activities will preserve a hybrid mosaic of habitat including maintaining the openness and structural diversity of grassland, strategic retention of shrub patches for the brown thrasher, and scattered perching opportunities and edge habitat features that are important for the American kestrel. Timing of mowing and enhancement actions will be planned to minimize disturbances during species' breeding seasons, ensuring that the habitat supports a range of grassland and grassland-adjacent species without conflict.

4.6 Mitigation Description

The proposed mitigation enhancement activities aim to improve habitat quality by diversifying plant species composition and structure, creating an ideal environment for savannah sparrow and other grassland-dependent birds.

The grassland preservation mitigation is designed to ensure the long-term viability of the grassland by addressing key ecological challenges, including woody plant encroachment and disturbance to nesting birds, especially during their critical breeding season. Central to this strategy is the implementation of a rotational mowing schedule, with one-third of the grassland fields being mowed each year with mowing activities deferred to late fall, allowing nesting birds, such as savannah sparrow and eastern meadowlark, to successfully rear their young.

Enhancement activities include the overseeding of grassland fields with a native seed mix and targeted removal of invasive and undesirable vegetation, particularly along field edges where woody plants encroach into grassland areas. Mechanical removal methods will be employed to clear these areas, opening space for native vegetation. Native wildflowers such as *Solidago* (goldenrod) and *Echinacea* (coneflower) will be seeded to enrich plant diversity, provide optimal ground cover,

and offer critical food resources for foraging grassland birds. A cover seed mix will also be applied to ensure coverage of bare ground and prevent unwanted plants from re-establishing. Refer to Table 3 Grassland enhancement seed mix.

To support a diverse range of species beyond grassland birds, a balanced mix of habitat types will be preserved and managed. Invasive and woody vegetation will be managed through selective removal, ensuring that some shrub cover remains to support transitional habitat zones that integrate both grassland and shrubland features. This method fosters gradual, structured edges rather than abrupt habitat transitions, which have been shown to lower nest predation rates for species compared to stark habitat boundaries.[21]

The following outlines the mitigation in more detail.

4.6.1 Timing and species windows

To minimize impacts on wildlife and breeding birds, enhancement and mowing activities will be carefully timed. The Connecticut Bird Atlas "Safe Dates"[22] suggest key breeding periods, such as May 10–August 1 for savannah sparrow in grasslands and May 10–July 20 for American kestrel in open country. To protect breeding birds, enhancement activities will occur outside the primary breeding season (April 1–August 30), with a fall schedule benefiting most species. Similarly, mowing will be limited to once per season after October 15, when birds and terrestrial wildlife like wood turtles are less active, preventing inadvertent injury or mortality.

With the commencement of the mitigation, agricultural activities at the mitigation site such as haying will no longer occur, allowing the site to prioritize grassland habitat preservation. Mowing will be carefully timed to support conservation goals, with a single late-season mow (after October 15) to promote biodiversity, maintain grassland structure, and prevent injury to wildlife. This shift in management will enhance habitat quality for grassland-dependent species by avoiding disturbances during breeding and nesting seasons while supporting the long-term ecological health of the site.

Table 2 Mitigation activity windows.

Mitigation Activity	**Time of Year for Activity to Occur**
Enhancement activities – removing invasive, undesired vegetation	October 16 to November 16 Selective removal of vegetation at the very end of the growing season.
Annual mowing – mow one-third of the grassland habitat each year	October 16 to November 16 Mowing to occur before the seeding of fields during the five-year enhancement and adaptive management period.
Enhancement activities - seeding	October 16 to November 16 The seeding cannot occur if the ground is frozen. The seeding to occur after mowing of the grassland fields.

[21] (Bird Conservation Network)
[22] (UCONN, 2024)

4.6.2 Removal of unwanted vegetation

To establish and sustain a dynamic grassland habitat mosaic, enhancement efforts will prioritize the selective removal of invasive species and encroaching woody vegetation that disrupt the openness and connectivity essential for grassland-dependent species. This approach will maintain scattered shrub patches to support species that rely on transitional habitat. Management efforts will also extend to invasive and undesired woody saplings and shrubs along adjacent forest edges, reducing their potential to spread into grassland areas while preventing the formation of abrupt habitat boundaries. This strategic, adaptive approach will help control invasive species while fostering a balanced, ecologically diverse landscape that accommodates both grassland and shrubland species.

Importantly, no herbicides or pesticides will be used in these management activities to protect the health of the ecosystem and avoid unintended impacts on non-target species.

To remove unwanted vegetation from the grassland site while minimizing disturbance, these practices will be followed:

- Vegetation removal will occur outside of the primary breeding and growing seasons (e.g., after October 15) to avoid disturbing nesting birds, pollinators, and other wildlife.
- Vehicular traffic shall be avoided from May 15 – September 15. Any access to the site during this period must be made by foot.
- Removals will not occur during wet conditions to prevent soil compaction and erosion.
- Hand tools like loppers, saws, and/or brush cutters will be utilized to remove individual saplings and shrubs, focusing on targeted vegetation without disturbing surrounding native plants.
- The uprooting of vegetation in a way that disturbs the soil significantly will be avoided, as exposed soil can invite further invasive species establishment. When complete root removal is not necessary, cutting vegetation at ground level will be prioritized rather than pulling out and uprooting the plant.
- Cut vegetation from the site will be removed to prevent reseeding or regrowth. Cut materials will be tarped and/or bagged and hauled from the site and disposed of per local ordinances.
- No herbicides or pesticides shall be used.

4.6.3 Seeding

Grassland fields will be seeded with a custom seed mix designed to include a variety of northeast/Connecticut native grasses and forbs. Additionally, a cover seed will be applied to further suppress the re-establishment of undesirable vegetation.

The seeding shall occur after the annual mowing, within the third of the grassland fields that were mowed. This timing ensures optimal seed-to-soil contact by taking advantage of the reduced vegetation height, which minimizes competition and promotes successful germination. The process will focus on distributing seed evenly across the designated area to achieve consistent coverage and support the establishment of native grassland species.

The custom seed mix is specifically designed to create an ideal grassland habitat for savannah sparrow in the Northeast, balancing ecological diversity with the structural requirements of their nesting and foraging needs. The inclusion of native grasses, such as *Schizachyrium scoparium* (little bluestem) and *Panicum virgatum* (switchgrass), provides the vertical structure and cover critical for ground-nesting birds, while supporting a stable habitat framework. The high proportion of wildflowers, including *Rudbeckia hirta* (black-eyed susan) and *Monarda fistulosa* (wild bergamot), ensures abundant insect activity for foraging and seed availability, which are vital components of the savannah sparrow's diet.

The seed mix also emphasizes species that are well-suited to the well-drained and moderately acidic soils typical of the region, ensuring long-term establishment and sustainability. By combining grasses and wildflowers in these proportions, the mix fosters habitat heterogeneity, which is crucial for supporting not only savannah sparrows but also other grassland-dependent wildlife species. This approach aligns with best practices for ecological restoration and long-term habitat enhancement.

Seed material, including cover crop seed shall be evenly applied over the recently mowed grassland fields in the late fall. The seed shall be spread and incorporated into the top quarter to top half inch of the soil. The seed shall be fresh, re-cleaned seed of the latest crop meeting the following standards of pure live seed content (purity & germination) and maximum allowable weed seed content. All seed shall be free of noxious weeds and undesirable grasses. The minimum germination rate shall be 80% and the maximum weed seed shall be 0.25%. All seed shall be delivered in sealed standard size bags of the vendor, showing weight, analysis, and name of vendor. The seed shall be stored in such a manner that its effectiveness will not be impaired.

Table 3 Grassland enhancement seed mix.

Botanical Name	**Common Name**	**Mix Percentage (%)**
Andropogon gerardii	big bluestem	5
Chamaecrista fasciculata	partridge pea	6
Coreopsis lanceolata	lance-leaf coreopsis	6
Coreopsis tinctoria	plains coreopsis	3
Desmodium canadense	showy tick-trefoil	5
Echinacea purpurea	purple coneflower	8
Heliopsis helianthoides	oxeye sunflower	4
Monarda fistulosa	wild bergamot	8
Panicum virgatum	switchgrass	10
Rudbeckia hirta	black-eyed susan	10
Schizachyrium scoparium	little bluestem	15
Senna hebecarpa	wild senna	3
Sorghastrum nutans	yellow grass	10
Symphyotrichum novae-angliae	New England aster	5
Zizia aurea	golden alexander	2

- *The cover seed mix will include both Avena sativa (oat) and Secale cereale (winter rye) each applied at a rate of 20 pounds per acre (a total of 40 pounds (lbs) per acre).*
  The native mix shall be at an application rate of 20 pounds (lbs) per acre.

4.6.4 Mowing regime

- Mowing will occur once a year, in late fall.
- Mowing will occur between October 16 – November 16.
- Mowing to occur before overseeding of the grassland fields (seeding to occur during the five-year enhancement and adaptive management period).
- Only one-third of the grassland areas will be mowed each year in late fall. This allows for a compromise between the need for overwintering species to be undisturbed for a year. These species require standing stems and aboveground biomass for nesting. The other two-thirds of the grassland will not be mowed in late fall, ensuring that there is adequate nesting material for grassland birds the following spring. In addition, rotational mowing allows for a greater source of insect food for the grassland birds in the spring and "would allow for a more natural progression of habitat as well as maintain a truer habitat mosaic for the benefit of all species present which utilize the grassland."[23]
- Mowing will be conducted at slow speeds and/or in low gear to allow animals to react and move out of the field.
- Flail mower heads with guide bars that ride along the ground shall be avoided. Sickle bar mowers have the least impact and shall be utilized.
- The mowing operator shall start mowing from the center of the field and use a back-and-forth approach, or large circular pattern, to avoid concentrating fleeing animals where they may be killed or stranded. A 30-ft strip around the perimeter of the field shall be mowed last. In addition:
    - If the field is near a stream: the mowing shall start on the side furthest from the stream and work towards the stream.
    - If the field is bordered by woodland: the mowing shall start on the side furthest from the woodland and work towards the woodland.
    - If the field is bordered by road, the mowing shall start next to the road and work inward, across the field.

4.7 Adaptive Management

Adaptive management will be conducted within enhancement areas over a five-year period, with fall vegetation surveys to occur each year. Follow-up bird surveys will occur annually in the spring, two growing seasons after the mitigation work commences and during the five-year management period. Surveys will use fixed plots or transects and document findings through notes, photographs, and GIS mapping. Based on survey results, adaptive management strategies, such as additional invasive species removal or reseeding, will be implemented during the enhancement activity window (October 16–November 16). Annual reports detailing survey findings, trends, and management actions will be submitted to CT DEEP each year during the five-year management period.

[23] CT DEEP NDDB Wildlife Biologist comments dated Feb 19, 2025, see Appendix A

4.7.1 Timeframe

- Adaptive management to occur over a five-year period upon completion of the initial enhancement plant removal and seeding activities.
- An annual vegetation survey will be performed in the fall between September 1 – October 15.
    - Based on the information gathered from the annual vegetation survey, the restoration team will recommend that adaptive management strategies are to be implemented as needed. These adaptive strategies shall be enacted during the enhancement activity window (i.e., October 16 – November 16).
- A follow-up bird survey shall be conducted in the spring, beginning two growing seasons after the mitigation work commences.
    - The surveys will be shared with CT DEEP NDDB's Wildlife Biologist no later than August 31st, to allow time for DEEP's review and provision of recommendations for adaptive management that can be enacted during the enhancement activity window (i.e., October 16 – November 16).

4.7.2 Adaptive management strategy

If invasive or woody species re-establish and/or grow excessively in areas after initial removal, additional mechanical removal will be employed, as needed over the five-year period. Woody vegetation will be selectively removed to preserve habitat permeability and to enhance the appeal of nesting habitat for grassland birds. However, the preservation of select shrub and hedgerow patches will be maintained to contribute to a diverse habitat mosaic. In addition, areas with insufficient native plant coverage will be reseeded as needed, using the approved seed mix. These activities will only be performed during the enhancement activity window from October 16 to November 16. This adaptive management strategy ensures that the enhancement areas progress toward the desired ecological outcome while maintaining high-quality habitat for grassland-dependent species.

4.8 Long-term Management

The preservation of the grassland habitat will be managed in perpetuity to ensure its ecological integrity and support for grassland-dependent species. Annual mowing, conducted in late fall, with one-third of the grassland habitat mowed each year, will remain a cornerstone of the management plan for the lifetime of the habitat. In addition to annual mowing, Joshua's Trust will perform selective vegetation control, removal of invasive species, and periodic monitoring to ensure the continued success of the habitat. Joshua's Trust is committed to the long-term management described herein as indicated in the email from John Hankins, President, in Appendix E.

This consistent management approach will maintain the grassland's structure, prevent encroachment by woody vegetation and invasive species, and sustain its value as a critical nesting and foraging area. The grassland will be forever protected through these ongoing efforts, ensuring its role as a vital ecological resource and habitat for generations to come.

Refer to the Financial Assurances & Responsible Parties section for more information on site ownership and protection of the mitigation site in perpetuity.

4.9 Maintenance and enhancement schedule

The mitigation schedule prioritizes minimizing impacts to sensitive species like grassland birds and wood turtles and includes a late fall window for mowing and enhancement activities and features a five-year adaptive management plan for enhancement areas.

Table 4 Maintenance and enhancement schedule.

Pre-enhancement bird surveys Includes 3 visits by an ornithologist during the grassland breeding season to conduct the site bird survey	May 10 – Aug 1 2026
Commencement of grassland maintenance and enhancement Includes annual rotational mowing in perpetuity (rotation includes mowing one-third of the grassland fields each year)	Sept 1 2026, and onward
Annual vegetation survey (sometime during Sept 1 to Oct 15) to occur during the 5-year adaptive management period	Sept 1 to Oct 15 in 2027, 2028, 2029, 2030 and 2031
Follow-up bird surveys Conducted in the spring during the 5-year adaptive management period, commencing two growing seasons after the mitigation work begins	Spring 2028, Spring 2029, Spring 2030, and Spring 2031
Enhancement activities of vegetation removals and native seeding, including adaptive management	Oct 16 to Nov 16 in 2027, 2028, 2029, 2030 and 2031
Final reporting on the mitigation	Dec 2031
Change site management to Joshua's Trust	Dec 2031

5. Financial Assurances & Responsible Parties

5.1 Responsible Parties

The Tweed New Haven Airport Authority (TNHAA) and The New HVN, LLC, as the permittee for the Proposed Project, will be the responsible parties for ensuring execution of this mitigation plan.

5.2 Land Ownership

It is anticipated that The New HVN, LLC, on behalf of TNHAA, will purchase the Warren property and will own the parcel and provide oversight and management of activities detailed in this plan, including the 5-year monitoring and potential adaptive management. Execution of legal interest documenting such will be forthcoming.

After the 5-year monitoring and adaptive management period, either ownership or a conservation easement will be enacted with Joshua's Tract Conservation and Historic Trust, Inc (Joshua's Trust) a nonprofit and largely volunteer regional conservation organization protecting more than 5,000 acres in Northeastern Connecticut. Joshua's Trust will then provide management in perpetuity after the 5-year period as detailed in this plan.

5.3 Financial Assurances

TNHAA and The New HVN, LLC will provide sufficient financial assurance to achieve successful execution of this Plan and transfer to Joshua's Trust for long-term management and stewardship. Details regarding this will be provided in the final mitigation plan submittal.

6. Conclusion

This grassland mitigation plan represents a comprehensive and forward-thinking approach to addressing the ecological impacts of the Tweed New Haven Regional Airport Runway Extension and Terminal Expansion. By focusing on habitat enhancement and long-term management, the plan seeks to create and sustain high-quality grassland habitats that support state-listed grassland birds and other wildlife.

At the heart of the mitigation strategy is the transition of the Warren Property (the mitigation site) from agricultural use to a protected grassland habitat managed in perpetuity. The plan prioritizes ecological integrity through targeted enhancements, including invasive vegetation removal and native seeding. Rotational mowing of one-third of the grassland fields each year will continue upon commencement of the mitigation and in perpetuity. Adaptive management practices, conducted over a five-year period, ensure that the habitat evolves to meet the needs of wildlife and achieve its ecological objective as an early successional grassland habitat.

A critical component of the plan is its long-term vision, supported by a partnership with the Warren family and Joshua's Trust. This collaboration ensures the site's perpetual protection and management, creating a model for successful mitigation and land stewardship. This mitigation plan embodies a commitment to preserving Connecticut's declining grassland habitats and the species that depend on them.

Appendix A- Regulatory Communication

Appendix A
Regulatory Communication

Date	**Entity**	**Communication Summary** *Includes but is not limited to a summary of highlights from each document. Refer to each source document included within this Appendix.*
April 8, 2024	Hoyle Tanner Associates (HTA) to Connecticut Department of Energy and Environmental Protection (CT DEEP)	HTA prepared a Grassland Bird Habitat Conceptual Plan and Grassland Habitat memo to address prior permitting requirements for grassland habitat within the airport boundary; document existing grassland habitat on the airport; and propose a study of bird use and functionality of existing grassland habitat at the airport. Attachments in this memo included: 1) 2008 Grassland Management Plan 2) 2011 Updated Grassland Management Plan 3) Grassland Management Plan Sheet 4) 2016 Wildlife Hazard Management Plan 5) Runway 2 Grasslands Plan 6) Runway 20 Grasslands Plan 7) 2022 NDDB Preliminary Determination Letter
April 25, 2024	CT DEEP to HTA	Robin Blum (of CT DEEP) emailed Notes on the CT Grassland Bird Habitat Conceptual Plan submitted by HTA. The notes include mention of conflicts at the airport with grassland habitat management and wildlife hazard management. The mowing practices at the airport, intended to maintain wildlife hazard safety, conflict with the original 2008 Grassland Management Plan. Due to an FAA 2011 update allowing exceptions for increased wildlife hazards, mowing has been consistently maintained at 7–14 inches. This deviates from the 2008 Grassland Management Plan's approach which included: 1) areas at the airport mowed regularly to maintain grass height of 4" to 14" and 2) areas mowed once a month. CT DEEP NDDB comments: "Estimated habitat loss is approximately 5.6 acres."
May 17, 2024	CT DEEP to HTA	CTDEEP letter to HTA requesting additional information on the NDDB. Includes lists of state-listed plant and grassland bird species documented to occur within the vicinity of the airport.

		CTDEEP states that state-listed plant species surveys of the site should be performed by a qualified botanist or plant ecologist and welcomes that a grassland bird survey be done. CTDEEP states, "[t]he Project is expected to impact 5.6 acres of grassland habitat." CTDEEP states, "…on April 29th, 2024, it was made clear that there is no remaining suitable grassland habitat on the property due to the mowing regime adopted in 2009." CTDEEP states, "[s]ince impacts to grassland birds have already been committed and earlier plan mowing regimes are not able to be implemented, off-site mitigation should be pursued."
July 31, 2024	CT DEEP to HTA	Includes a letter from CT DEEP to HTA of a summary of outstanding issues for NDDB review. CT DEEP requests that the airport mowing regime be clarified and that updated Wildlife Management and Grassland Management Plans for the airport be provided.
October 23, 2024	CT DEEP to HTA	Includes an email from CT DEEP to HTA of natural history needs of grassland birds and requirements for off-site grassland bird mitigation. CT DEEP states "… we will be looking for a minimum of 25 acres for offsite mitigation and may require more if the habitat needs enhancement, part of the soils are excessively wet, or areas of the parcel are not favorable for nesting by this species for some other reason. Please note that we will require documentation of current species use of the mitigation area to consider minimum acreage proposals."
November 6, 2024	Federal Aviation Administration (FAA) to Tweed New Haven Airport Authority	Email from FAA stating the preference for offsite grassland mitigation.
November 25, 2024	Monthly permitting meeting attendees (CT DEEP, USACE, FAA, Avports, HTA, BSC Group, WSP, EDD)	[This Appendix includes regulatory communication information relevant to the grassland mitigation only.] Meeting notes include that: • The grassland impact has been revised to approximately 4 acres; on-site mitigation is not feasible. • CT DEEP awaits a detailed management plan and conservation approach for the off-site mitigation Warren parcel. • Seeds have been collected for the Plant Mitigation Plan (Native Plant Trust involvement).

February 19, 2025	CT DEEP NDDB to HTA	CT DEEP NDDB states that the plan must address potential impacts on brown thrasher, a documented species on-site that relies on shrubby habitat. Additionally, CT DEEP NDDB requests annual bird surveys beginning in 2028, adjustments to the proposed mowing regime (including a 1/3 – 1/3 – 1/3 pattern and specific mowing techniques to minimize wildlife impact), and coordination with Joshua's Trust for long-term vegetation management post-conveyance.

HOYLE TANNER

Trusted Experts | Innovative Results

Memo

To:	CTDEEP
From:	Kimberly Peace – Hoyle, Tanner & Associates, Inc.
Date:	April 8, 2024
Re:	Tweed New Haven Airport Runway Extension and East Terminal Project Grassland Habitat

Hoyle Tanner & Associates, Inc. (Hoyle Tanner) has prepared this memo to:

1. Address prior permitting requirements for Grassland Habitat within the airport boundary;
2. Document existing grassland habitat on the airport; and,
3. Propose a study of bird use and functionality of existing Grassland Habitat at the airport.

Prior Permitting Requirements

A requirement of CTDEEP permit #200003049-KZ dated May 8, 2007, Special Terms and Conditions #14:

> *14: Prior to the completion of the work authorized herein, the Permittee shall seed disturbed land adjacent to the reconstructed/extended Taxiway Bravo, disturbed lands east and west of the Runway-20 RSA, the area to be disturbed immediately northwest of the Runway-2 RSA and the RSAs themselves with a mixture of "warm seasonal grasses" consisting of 60 percent little bluestem, 20 percent indiangrass and 20 percent switchgrass, making up approximately 23 acres of new or enhanced grassland habitat. Within 30 days of completing the grass seeding, the Permittee shall submit for the review and written approval of the Commissioner a mowing plan for the 23 acres of grassland noted above. The Permittee shall conduct mowing of these grassland areas in accordance with the approved plan unless otherwise authorized in writing by the Commissioner*.

Upon review of that permit and submittals, it is understood that the area in question of 23 acres was intended to be comprised of the approximately 500'X1000' RW 2 Safety Area and the 500'X1000' RW 20 Safety Area. Permits IW-2000-116, DIV-200003052 and WQC-200003051 also have conditions relating to grassland habitat and planning.

Grassland Management Plan

A Grassland Management Plan (to serve as the mowing plan referenced in the condition above) was developed and submitted to CTDEEP in response to this permit condition (Attachment 1). The original plan was dated February 2008, and noted that the plan as developed to serve as a **guideline** for grassland management at the airport, but that goal has to remain in balance with the FAA's requirements, specifically FAA Advisory Circular 150/5200-33 *Hazardous Wildlife Attractants on or near Airports.* Notably, the 23-acre RSAs that were planted with warm season grasses were identified as, to address FAA requirements, being mowed between heights of 4-6 inches.

Further coordination with FAA resulted in a supplement to that plan, dated April 2011 that was developed in response to the continued wildlife hazard issues that the airport was facing as documented in their Wildlife Hazard Management Plan (Attachment 2). Specifically, areas that were initially identified as non-safety or non-critical areas that could be mowed once annually and not before September 1, were shifted to allow for mowing as needed to prevent seed growth and heights at which the grasses could be used for food or cover. This was in response to several wildlife hazard incidents, and **it is crucial to future efforts that all parties recognize that the airport currently continues to follow this supplemented plan and mows all grassed areas as needed to keep grasses between 7"-14" to reduce the potential for grasses to attract wildlife, including grassland birds. See the Grassland Management Plan that has been updated to reflect this (Attachment 3).**

Note that this condition is included in the airport's most recent Wildlife Hazard Management Plan dated April 2016, see Table 1 (Attachment 4).

The FAA's FONSI for this project, dated December 2023, includes a requirement that the current Grassland Management Plan be updated, and that the airport maintain compliance with that plan.

Existing Grassland Habitat

To date, as shown in the figures provided in Attachments 5 and 6, the areas around Runway 2 and Runway 20, including the corresponding RSAs and Taxiway Bravo that are currently managed grassland habitat are as follows:

Area	Currently	Proposed Impact	Total After Completion
Runway 20	11.6 acres	1.5 acres	10.1 acres
Runway 2 and TW B	23.1 acres	4.1 acres	19 acres
Total			**29.1 acres**

There is additional grassland habitat in areas between the taxiways and runways and along the length of both runways that is not included in this accounting exercise as this was designed to specifically address this prior permit condition, however, it is worth noting that the total area of grassland habitat within the airport is significantly higher than 23 acres.

Grassland Impacts

As noted in the EA and confirmed in the FONSI, while the construction of the proposed development will reduce grassland habitat within the airport, it will not significantly affect local or regional populations of wildlife species because those found on the Airport are mobile and adaptable to transition in adjacent habitats. Furthermore, the Project would adhere applicable conservation recommendations from CT DEEP as per their NDDB Preliminary Determination letter dated March 3, 2022 (Attachment 7) that notes that the applicant must comply with pre-existing mitigation plans prepared to protect grassland birds.

The applicant feels like the site is currently, and will in the future condition, be in compliance with the existing permit requirements.

Grassland Bird Functionality and Survey

To determine if the mowed grassland habitats on Tweed Airport currently provides breeding habitat for grassland bird species, the applicant proposes conducting a standard Breeding Bird Census type survey, consisting of three visits during the 2024 breeding season. Data available from eBird suggests that

Tweed Airport (https://ebird.org/barchart?r=L4208182&yr=all&m=) and surrounding open habitats (https://ebird.org/barchart?r=L466566&yr=all&m=) are infrequently used by low numbers of migrating or overwintering bird species associated with open habitat types.

This survey would be offered as mitigation for the loss of grassland habitat due to the proposed development.

Methodology:

For standard grassland point count surveys, each point location consists of a 100-meter radius plot centered on the observation point with a minimum distance of 250 meters between observation points. Points would be identified through a desktop evaluation of the survey area and GPS located in the field. All birds seen/heard within approximately 100 meters of a point are recorded, and birds observed beyond 100 meters from a point while traveling between points are also recorded. Surveys are conducted between a half hour before sunrise and 9:00 AM. Surveys are not conducted during inclement weather, including precipitation, fog, or strong winds (i.e., greater than 10-12mph). Point counts are conducted for five minutes after an initial 1-2 minutes of silence after arriving at the point to allow birds to recover from any disturbance. Data recorded for each survey point includes date; surveyor name; point number; start and end time; and weather information (temperature, wind speed and direction, precipitation and cloud cover), species observed, number of individuals per species, and behavior (carrying food, flying, perching, singing, displaying, etc.). Surveys must be conducted by personnel able to identify CT grassland birds in the field by song and by sight.

Gina McCarthy, Commissioner
CT DEPARTMENT OF ENVIRONMENTAL PROTECTION
79 Elm Street
Hartford, CT 06106
ATTN: Marla Butts, Inland Water Resources Division

Re: Grassland Management Plan – Tweed-New Haven Airport
Permit # IW-2000-116, DIV-200003052, WQC-200003051

Dear Commissioner McCarthy:

Pursuant to Special Condition #1 of the above-referenced permits, the attached Grassland Management Plan (the 'Plan') is being submitted for review and written approval by the CT Department of Environmental Protection (DEP). Special Condition #1 of these permits states:

> The permittee shall provide in writing for review and approval to the Department within 60 days of the issuance of this permit, a long-term management plan for the airport property with the goal of preserving and maintaining habitat for grassland bird species, including the Horned Lark (*Eremophila alpestris*), Grasshopper Sparrow (*Ammodramus savannarum*) and Savannah Sparrow (*Passerculus sandwichensis*).

Accordingly, the attached *Grassland Management Plan* (the 'Plan') has been prepared in accordance with and is intended to comply with Special Condition #1 of the DEP permits.

Specifically, the *Grassland Management Plan* outlines a series of proposed measures associated with the maintenance of grassed areas resulting from implementation of the runway safety area and taxiway improvements at Tweed-New Haven Airport. It is important to note, however, that the goal of grassland management must be carefully balanced with the airport's primary goal of maintaining aviation safety. It is within the context of aviation safety that this program is proposed.

The grassland management plan described herein has been developed with consideration of the Federal Aviation Administration (FAA) Advisory Circular 150/5200-33B, *Hazardous Wildlife Attractants on or near Airports,* which states that "Land use practices that attract or sustain hazardous wildlife populations on or near airports can

significantly increase the potential for wildlife strikes." In this light, the goal of this program is to provide safe operating conditions at Tweed-New Haven Airport while contributing to the conservation of listed grassland bird species. In this manner, the grassland management plan strives to maintain appropriate habitat that is adequately and safely separated from airport operations.

Lastly, it is anticipated that the grassland management measures included herein will be used as **guidelines** for grassland management at the Airport. Thus, while the Plan allows for the management of grasslands, particular attention will be paid to the effect that higher grass heights may have on attracting other hazardous wildlife species.

In closing and in accordance with General Conditions #11, the undersigned hereby certifies that:

> "I have personally examined and am familiar with the information submitted in this document and all attachments. I certify that, based on reasonable investigation, including my inquiry of those individuals responsible for obtaining the information, the submitted information is true, accurate and complete to the best of my knowledge and belief. I understand that any false statement made in this document or its attachments may be punishable as a criminal offense in accordance with section 22a-376 under section 53a-157b of the Connecticut General Statutes."

Thank you for your review of this material and please contact me with any questions.

Sincerely,

Hoyle, Tanner & Associates, Inc.

Robert Furey, PE, Vice President

GRASSLAND MANAGEMENT PLAN

PERMIT # IW-2000-116, DIV-200003052, WQC-200003051
TWEED-NEW HAVEN AIRPORT

Prepared for:
Tweed-New Haven Airport Authority

Prepared by:
Hoyle, Tanner & Associates, Inc.

In association with:
Wetlands & Wildlife, Inc.

February 2008

1.0 INTRODUCTION

1.1 Background

On 1 May 2007, the CT Department of Environmental Protection (DEP) issued permits to the Tweed-New Haven Airport Authority (the 'Authority') to construct the proposed Runway Safety Area & Taxiway Improvements at Tweed-New Haven Airport (the 'Airport'). Special Condition #1 of these permits states:

> The permittee shall provide in writing for review and approval to the Department within 60 days of the issuance of this permit, a long-term management plan for the airport property with the goal of preserving and maintaining habitat for grassland bird species, including the Horned Lark (*Eremophila alpestris*), Grasshopper Sparrow (*Ammodramus savannarum*) and Savannah Sparrow (*Passerculus sandwichensis*).

Accordingly, this Grassland Management Plan (the 'Plan') has been prepared in accordance with and is intended to comply with Special Condition #1 of the DEP permits.

1.2 Project Summary

In order to comply with Federal Aviation Administration requirements, the Authority applied and was issued permits for the construction of runway safety areas (RSAs) at each end of Runway 2/20, as well as the extension of Taxiway 'B' and the rehabilitation of Taxiways 'B' and 'E'. More specifically, these improvements include the actions listed in Table I, below.

TABLE I

RUNWAY SAFETY AREA AND TAXIWAY IMPROVEMENTS
TWEED-NEW HAVEN AIRPORT

IMPROVEMENT/ACTION	DESCRIPTION
Runway 2 Safety Area	- 1,000-foot by 500-foot RSA - Relocation of Morris Creek
Runway 20 Safety Area	- Modified 1,000-foot by 500-foot RSA - Relocation of Tuttle Brook/Morris Creek - Relocation of Dodge Avenue
Taxiway 'B' Extension/ Taxiway 'E' Rehabilitation	- Reconstruction/Strengthening Taxiways 'E' and 'B' - Extension of Taxiway 'B'
Wetland Mitigation Program	

The proposed Runway 2 safety area will entail the rechannelization of a portion of Morris Creek. This new channel will consist of a meandering alignment more akin to a natural creek bed. Grading of the Runway 2 safety area is designed specifically to 1) minimize the placement of fill in the 100-year flood plain and 2) keep the RSA dry in a 5-year rainfall event.

The proposed Runway 20 safety area will entail the rechannelization of Tuttle Brook/Morris Creek and the relocation of Dodge Avenue. A 584-foot-long segment of Tuttle Brook/Morris Creek will be placed in a culvert beneath the runway safety area and relocated Dodge Avenue. A length of existing Dodge Avenue will be removed, decommissioned as a public right-of-way and incorporated into the boundaries of the airport as runway safety area. A new Dodge Avenue will be constructed between the end of the runway safety area and the rear of properties along Holmes Street.

Proposed taxiway improvements include the reconstruction/strengthening of Taxiway 'E' and the reconstruction/strengthening/extension of Taxiway 'B.' By these actions, Taxiway 'B' will become a full parallel taxiway, eliminating the need to use the primary runway, i.e. Runway 2-20, for taxi movements. Under existing conditions, such movements decrease safety margins and reduce the efficiency and utility of runways.

The locations of the RSA and taxiway improvements, as well as existing airfield vegetated areas on the airfield that will not disturbed by this the proposed project are presented in Figure 1.

2.0 GRASSLAND MANAGEMENT PLAN

This *Grassland Management Plan* outlines a series of proposed measures associated with the maintenance of grassed areas resulting from implementation of the runway safety area and taxiway improvements at Tweed-New Haven Airport (the 'Airport'). It is important to note, however, that **the goal of grassland management must be carefully balanced with the airport's primary goal of maintaining aviation safety.** It is within the context of aviation safety that this program is proposed.

2.1 Overview

While formerly common, natural grasslands are a vegetative community in decline in the New England region due to a combination of natural succession, development, and a decline in farming. Consequently, populations of grassland birds also have declined. As stated in *Conserving Grassland Birds*[1], "We are rapidly losing these [bobolinks and eastern meadowlarks] and other grassland birds that were once a common and integral part of our countryside. As land use and agricultural practices have changed dramatically since the turn of the century, remaining grasslands have become smaller and isolated."

Accordingly, many airports that maintain extensive grassland areas, over time, have come to provide not only favorable habitat but in some instances the only habitat for grassland birds over large geographic areas. This relationship, however, can be a significant aviation safety concern, particularly when there is an increase of the risk, frequency and potential severity of wildlife-aircraft collisions.

As documented throughout the environmental review and permitting process, the DEP has expressed concern relative to the runway safety area and taxiway improvements at the Airport due to the potential presence of grassland birds. In their review of project permit applications, for example, CT DEP set forth the following comment:

> A review of Endangered, Threatened, and Special Concern species has been conducted for the proposed project location. This review has identified *Panicum amarum* a listed State Threatened species to be known to grow in coastal dunes and beaches. It appears that the proposed project will not impact this type of habitat. However, the review has also identified a State listed bird species that may be impacted as a result of the proposed activity. You need to contact Jenny Dickson of the DEP-Wildlife Division directly on this issue. Please forward Ms. Dickson's comments to this Office for further review regarding these issues.

[1] Jones, Andrea L. and Peter D. Vickery. Undated. *Conserving Grassland Birds: Managing Small Grasslands including Conservation lands, Corporate Headquarters, Recreation Fields, and Small Landfills for Grassland Birds.* Grassland Conservation Program/Center for Biological Conservation. U. S. Fish and Wildlife Service/MA Audubon Society. Lincoln, MA.

In accordance with the DEP comment, Ms Dickson was contacted by Wetlands & Wildlife, Inc. on 25 September 2001. According to Ms. Dickson, the primary species of concern was the horned lark (*Eremophila alpestris*), a ground nesting State-listed Threatened bird that favors open areas and grasslands. Other State-listed grassland species also were noted by Ms Dickson as potentially occurring onsite, including the Endangered grasshopper sparrow (*Ammodramus savannarum*) and Savannah sparrow (*Passerculus sandwichensis*), a Species of Special Concern. Based on *The Atlas of Breeding Birds of Connecticut*[2], each of the above-referenced species has been documented from airport grasslands, most notably Bradley International Airport in Windsor Locks. Enser (1992) also noted the occurrence of these species at airports in Rhode Island.[3]

To mitigate potential impacts to these species, Ms. Dickson recommended that areas disturbed during construction and located outside proposed pavement or wetland mitigation areas be planted with 'warm season grasses' (see Attachment B). Accordingly, this recommendation was incorporated into the permit applications and re-vegetation plan filed with DEP.

2.2 Plan Goals and Objectives

The grassland management plan described herein has been developed with consideration of the Federal Aviation Administration (FAA) Advisory Circular 150/5200-33B, *Hazardous Wildlife Attractants on or near Airports,* which states that "Land use practices that attract or sustain hazardous wildlife populations on or near airports can significantly increase the potential for wildlife strikes." In this light, the goal of this program is to provide safe operating conditions at Tweed-New Haven Airport while contributing to the conservation of listed grassland bird species. In this manner, the grassland management program strives to maintain appropriate habitat that is adequately and safely separated from airport operations

It is anticipated that the grassland management measures included herein will be used as **guidelines** for grassland management at the Airport. Thus, while the Plan allows for the management of grasslands, particular attention will be paid to the effect that higher grass heights may have on attracting other hazardous wildlife species such as deer, coyote, fox, raccoons, striped skunks, turkeys and raptors.

Accordingly, bird populations within the newly planted areas and especially off each new runway end will be monitored following project implementation, and increases in hazardous wildlife, bird strikes or other wildlife-related event (if any) will be documented. Assuming such increases are documented and, in turn, considered sufficient to warrant concern for aircraft/passenger safety, the Plan will be immediately modified and DEP so notified in an effort to establish and implement remedial measures satisfactory to both the DEP and Airport Authority.

---

[3] Enser, Richard W. 1992 The Atlas of Breeding Birds in Rhode Island. RI Department of Environmental Management. Providence, RI

2.3 Grassland Management Plan Implementation

As described in the environmental permit applications filed with DEP, warm season grasses will be planted at multiple locations to be disturbed in conjunction with RSA and taxiway improvements. These sites will include an upland area adjacent to reconstructed/extended Taxiway 'B', disturbed uplands east and west of the Runway 20 safety area, the upland area to be disturbed immediately south and west of the Runway 2 safety area, and the runway safety areas, themselves.

In this regard, it should be noted that each safety area, measuring 500' wide by 1,000' long, alone will provide approximately 11.5 acres of grassland habitat and 23 acres overall. A listing of the warm season grasses to be planted is provided in Table II.

In keeping with DEP guidance, a seed mix consisting of 60% little bluestem, and 20% each of indiangrass and switchgrass will be planted in accordance with the listed considerations. The majority, if not all, areas planted with 'warm season grasses' also will be periodically mowed, as described below. In addition to enhancing airport safety conditions, periodic mowing also will enhance grassland habitat conditions onsite.

Figure 1 depicts these and other airfield areas with the following color-coded distinctions:

- Airfield Safety Area and Glideslope Critical Area for Proposed Project
- Airfield Non-Safety/ Non-Critical Areas for Proposed Project
- Existing Airfield Vegetation ed Areas not Disturbed by this Proposed Project
- Proposed Water bodyBody

It is important to note, however, that the post-construction management of lands disturbed in conjunction with RSA and taxiway improvements will be conducted in a manner that is anticipated to deter wildlife species known to be aviation hazards from critical operational areas, including those species listed in the previous section. In this regard, critical operational areas include the lands 250 feet on either side of the Runway 2/20 center line, lands adjacent and parallel to much of the reconstructed Taxiway 'B', and the actual runway safety areas. For the proposed project, these areas are shown and listed on Figure 1 as *Airfield Safety Area and Glideslope Critical Area for Proposed Project.* Each of these obstruction free zones is required for Airport compliance with the 14 CFR Part 139 certification criteria as established by the FAA. Accordingly, while planted with warm season grasses, these areas will be mowed on a regular basis, typically prior to grasses reaching a height of 4 – 6 inches (see Figure 1).

All other non-critical operational areas disturbed in conjunction with RSA and taxiway improvements only are expected to be mowed once annually, with mowing anticipated to occur in the late summer/early fall, but under no circumstances prior to September 1st during any given year. For the proposed project, these areas are shown and listed on Figure 1 as *Airfield*

Non-Safety/ Non-Critical Areas for Proposed Project. Depending upon climatic and vegetative growth conditions, however, an early spring mowing also may be implemented, but under no circumstances later than April 15th during any given year.

Ultimately, the Airport Manager will be responsible to maintain airfield vegetation in accordance with the grassland managementis plan. The Pplan will be distributed to Airport Operations personnel and Airport Maintenance personnel, including the Airport Rescue and Fire Fighting (ARFF) staff. The same group of personnel are aware of FAR Section 19 § 139.337 Wildlife Hazard Management, and will be trained on how to balance the requirements of aviation safety in 139.337 with the requirements of this plan. As stated in Section 2.2 - Plan Goals and Objectives, if future bird populations increase causing an increase in bird strikes (as documented through the ongoing monitoring of bird populationsplan), the Pplan will be modified and DEP notified in an effort to establish and implement remedial measures satisfactory to both the DEP and Airport Authority. The Airport Manager will be responsible to facilitate this process, and will solicit staff feedback on the bird population monitoring plan and resulting data on an annual basis. This measure will tie closely with the Airport's annual safety inspections such that maintaining airfield safety inspection logs will be part and parcel to maintaining this plan.

As described below, Plan implementation is anticipated to benefit the horned lark, as well as the grasshopper and Savannah sparrow and other grassland birds.

2.4 Discussion

2.4.1 Horned Lark

Based on the *Endangered and Threatened Species Series Fact Sheet* for the horned lark (DEP; December 1999), this species nests in "large, open areas that are barren, sandy, stony, or have sparse grass cover. In Connecticut, the horned lark nests on beaches and open areas, mostly along the coast. Breeding has also been documented in grassland areas at airports." As noted by Sample and Mossman (1997)[4], the horned lark is a "shortgrass species", preferring habitats with very short and sparse vegetation or bare soil, such as plowed agricultural fields, heavily grazed pasture, and dry prairies. Consequently, this species is expected to be most attracted to the regularly maintained portions of the overall airfield, i.e. locations where mowing is intended to discourage bird activity.

Regardless, mowing within critical operational areas is not anticipated to totally preclude the use of these areas by horned larks for feeding, or their potential nesting within non-critical areas where mowing will be limited. It should be noted, however, that according to the above-referenced DEP *Endangered and Threatened Species Series Fact Sheet*, "Horned larks are common migrants and winter visitors in Connecticut, but are rare nesters."

[4] Sample, David W. and Michael J. Mossman. 1997. *Managing Habitat for Grassland Birds: A Guide for Wisconsin.* WI Department of Natural Resources. Madison, WI.

TABLE 2-II
FAA APPROVED WARM SEASON GRASSES FOR THE ENHANCEMENT OF GRASSLAND BIRD HABITAT

Common Name	Scientific Name	Cultivar
little bluestem	*Schizachyrium scoparium*	'Aldous' or 'Cimarron'
big bluestem	*Andropogon gerardii*	'Niagra'
indiangrass	*Sorghastrum nutans*	'Rumsey'
switchgrass	*Panicum virgatum*	'Blackwell', 'Shelter' or 'Cave-in-Rock'
Bermudagrass	*Cynodon dactylon*	'Quickstand'

Seed mix ratios are variable. However, for Connecticut, a minimum of 60% little bluestem is preferred. A good sample seed mix is as follows:

60% little bluestem, 20% indiangrass, 20% switchgrass.

Big bluestem is an acceptable alternative to little bluestem for the dominant species in the chosen mix. When one of the bluestems is utilized as the dominant species the other grass species listed may be mixed in any ratio desired. Of these species, Bermudagrass is the least favored and should thus be used in the lowest percentage.

Other Considerations

Seeding Requirements:

- firm seed bed before and after planting
- use appropriate seed covering

Seed Bed Preparation:

- pH of 5.5-6.5
- soil temperature approximately 60° F
- planting depth: 1/4" -1/2"
- recommended use of 0-20-20 fertilizer, based on soil test; apply no nitrogen until the stand is established (late summer; use 20-40 lbs for half season)

When evaluating the stand, please note that many of these grasses do not reach their full growth until the second growing season.

Source: CT Department of Environmental Protection/Wildlife Division

2.4.2 Grasshopper and Savannah Sparrows

While also characterized as a "shortgrass species" by Sample and Mossman (1997), they note that the grasshopper sparrow requires some bare soil, but is "most common in habitats with relatively short (5 – 20 cm height-density [i.e. 2 – 8 inches]) vegetation and fairly diverse structure." In contrast, Sample and Mossman (1997) characterize the Savannah sparrow as a "midgrass species" and a "habitat generalist" that "Occurs in habitats with a broad range of vegetation structure; most common in fairly lush, short to medium height grasslands (e.g., hay, pasture). Often uses stiff-stemmed forbs for song perches."

These habitat characteristics are confirmed by Jones and Vickery in *Conserving Grassland Birds*, wherein the vegetative structure for grasshopper sparrows is described as "Short bunch grasses (ht.: 4 – 12") with minimal litter and grass cover, patches of bare ground, scattered tall forbs (ht.: 8 – 25") and short shrubs (ht.: 1 – 8") for song perches." With respect to Savannah sparrows, Jones and Vickery describe the requisite vegetative structure as "Mixed grass (ht.: 8 – 12") old hayfields >8 years old with relatively sparse ground cover, usually in lowlands with moist soil; prefer mosaic of grasses, sedges, and scattered broad-leaved forbs with <25% shrub cover."

The habitat requirements of these two sparrows is further confirmed by Sibley (2000)[5], who describes the habitat of grasshopper and Savannah sparrows as "tall, dense grass" and "a variety of grassy habitats", respectively.

Based on these habitat requirements, the limited mowing cycle associated with non-critical operational areas is expected to enhance the habitat viability of these areas for grasshopper and Savannah sparrows.

[5] Sibley, David A. 2000. *The Sibley Guide to Birds*. Alfred A. Knopf, Inc. New York, NY.

3.0 SUMMARY

The above-described Grassland Management Plan has been prepared in accordance with and is intended to comply with Special Condition #1 of the DEP permits and outlines a series of proposed measures associated with the maintenance of grassed areas resulting from implementation of the runway safety area and taxiway improvements at Tweed-New Haven Airport. As described herein, a mowing regime is proposed relative to locations to be disturbed in conjunction with RSA and taxiway improvements. These practices are anticipated to benefit such State-listed grassland birds as the horned lark, as well as the grasshopper and Savannah sparrow, and other grassland birds.

It is important to note, however, that **the goal of grassland management must be carefully balanced with the airport's primary goal of maintaining aviation safety.** It is within the context of aviation safety that this program is proposed.

Re: Tweed-New Haven Airport

Dear Mr. Dennis:

The materials you provided to me regarding proposed runway modifications at Tweed-New Haven Airport address the mitigation needs for potential state-listed grassland bird impacts in a comprehensive way. Your are correct in your indication that use of the recommended seed mix may improve or actually enhance habitat available for these birds. There are two points, however that merit mention.

Mowing needs to comply with FAA regulations for the protection of aircraft safety zone, however a mowing schedule should be developed for Tweed-New Haven Airport which would limit mowing activity in non-critical areas during the birds' nesting period. A similar mowing agreement is currently in place at Bradley International Airport. I would be happy to work with DOT Aviation and Ports staff or airport personnel on such an agreement at the appropriate time.

One thing it is important to recognize about this group of grassland birds is that they are not "flocking" birds. They spend much of their time at ground level foraging and the reaction of many of them is to run when startled rather than fly. This behavior makes them much less likely to be a problem in terms of airstrikes. In addition, mowing these warm-season grasses at longer intervals generally discourages other birds such as Canada geese, starlings, and gulls. These species are all "flocking birds" and can pose significant threats to aircraft. As a result, management for many grassland birds not only benefits state-listed species, but can help an airport alleviate other wildlife-related problems.

The Wildlife Division would be happy to work with the airport on any bird-related concerns that arise in the future. Given the low population levels of state-listed grassland birds, these improvements are unlikely to attract huge numbers of grassland birds. A subsequent "reseeding to a less desirable seed mix" is not something the Division is likely to support unless all other options have been explored and the Division has made the determination that this is the best course of action. This type of decision cannot be made solely by airport staff. This significant habitat alteration would amount to a "taking" of species protected by the Connecticut Endangered Species Act.

Please feel free to contact me if you have additional questions regarding grassland bird management at airports.

Sincerely,

Jenny Dickson
Wildlife Biologist

cc: K.Zavoy

RE: PERMIT # IW-2000-116, DIV-200003052, WQC-200003051
Grassland Management Plan (Original February, 2008)
UPDATE, November 2010

Dear Mr. Zawoy:

Thank you for taking the time to visit our airport on September 14th, 2010. During your visit and discussions with Mr. Marshall Dennis and Mr. Charles Kurtz, you expressed interest in the airport's current mowing procedures in both the airfield safety and non-safety/non-critical areas. The following discussion (as related to our February 2008 Grassland Management Plan) is intended to address your concerns.

As stated in the original February, 2008 Grassland Management Plan, filed with DEP in February 2008, certain procedures can and should be updated based on the observations of Airport staff as related to the the safety of the Airport. The 2008 plan outlines mowing procedures for the safety critical areas of the airport, reference Drawing No. 1 of the plan. The following discussion summarizes wildlife activities at the airport from April 2009 to present, or since the completion of runway safety area improvements at the south end of the airport.

The airport monitors wildlife on and near the airfield in accordance with 14 CFR Part 139 Section §139.337 Wildlife Hazard Management, and has developed and maintains their own specific Wildlife Hazard Management Plan. The plan places a particular emphasis on identification and abatement of wildlife hazards within the airfield environment. The plan ensures that the Airport will take immediate measures to identify and mitigate wildlife hazards whenever they are detected or whenever airport management has been advised that hazardous conditions exist. The plan outlines steps for monitoring, documenting, and reporting potential wildlife hazards and strikes at the Airport. Protocols for responding to hazardous wildlife situations are presented, including roles and responsibilities of airport personnel.

Pursuant to the plan, the Airport has encountered steady levels of wildlife hazard incidents which have been successfully mitigated through implementation of the plan. One of the most common hazards to airfield safety has been bird strikes. The airport finds it is necessary to maintain mowing procedures within safety critical areas, as shown on Drawing No.1 of the 2008 Grassland Management Plan. Within non-safety critical areas, Airport maintenance staff limits

mowing as much as practicable without allowing wildlife attractants to increase the frequency of potential bird strikes. However, in the event an increase in wildlife attractants (insects, vectors, herbivores, small and large mammals) is observed by airport staff, non-critical safety areas that abut critical areas are mowed. This further reduces the risk of wildlife hazards within both safety and non-safety critical areas. Conversely, when wildlife attractants are deemed to be at an acceptable and safe level, non-critical safety areas are mowed in accordance with the Grassland Management Plan.

This update is intended to supplement the 2008 plan for two reasons:

1) Inform CT DEP that the airport maintains the 2008 Grassland Management Plan through standard wildlife management procedures and standard grounds maintenance procedures. The plan illustrates the intended mowing areas and delineates these areas according to a purposeful balance between wildlife management and airport safety. These procedures are briefed at the airport on a quarterly basis and are made a part of standard training procedures for all airport staff.

2) Report that as much as practicable, the Airport is limiting mowing of non-safety critical areas in accordance with the 2008 plan. However, CT DEP should be aware that the plan was intended to serve as a set of guidelines and to be amendable, as needed, to ensure overall Airport safety. Therefore, the airport wishes to inform CT DEP that minor deviations the 2008 plan (mowing procedures in non-safety critical areas) have been deemed necessary in the past 18 months to maintain safe airfield operations. These occasions have been dealt with as exceptions to the plan, and have not permanently altered standard operating procedures. Further and potential future deviations will be handled on a case by case basis and will be managed with sensitivity towards the goals and objectives of the 2008 Grassland Management Plan.

Respectfully,

Lori Hoffman-Soares
Airport Manager

19. WILDLIFE HAZARD MANAGEMENT PLAN 139.337

INTRODUCTION

Tweed-New Haven Regional Airport is located in southern Connecticut and is surrounded by various types of habitat that are prone to attracting numerous types of wildlife in varying sizes. Wildlife hazards at Tweed are both avian and mammalian, including turkey vultures, ospreys, red-tailed hawks, coyotes, and foxes, and especially white-tailed deer as evidenced by the deer strike in September 2012.

In addition to Tweed's proximity to marshes and wooded areas, it also lies near the Quinnipiac River, which serves as a food source for large birds like osprey, which can sometimes be seen flying overhead across the airfield carrying a fish. Moreover, the airport property contains within the perimeter fence large safety areas comprised of vast expanses of grass, which serve as an attractant to many varieties of smaller birds, some of which flock in large numbers.

This plan will serve as a guideline by which employees at Tweed and USDA WS will prevent, mitigate, and in some cases, depredate wildlife hazards on the airport property as they arise.

Purpose

This plan addresses the requirements of FAR Part 139.337, Wildlife Hazard Management, as requested by the Federal Aviation Administration, for Tweed-New Haven Regional Airport (HVN). This plan will be reviewed annually or more frequently as conditions merit, and shall be revised as necessary to keep the plan current. The plan establishes procedures for minimizing wildlife hazards to aircraft operations at Tweed-New Haven Regional Airport and requires immediate action be taken to alleviate wildlife hazards whenever they are detected. Procedures to immediately alleviate wildlife hazards include advisories to the Air Traffic Control Tower about hazards, runway sweeps to scare wildlife or depredation.

Definitions

Progressive management techniques: Part of an integrated wildlife management on the airfield. A stepped plan of harassment to depredation will occur using this method. First attempt at harassment will be chasing wildlife with vehicles/horn or sirens. Second attempt at harassment will be the use of pyrotechnics. Third will be lethal removal of wildlife by USDA WS.

Tweed: Tweed-New Haven Regional Airport

Wildlife Coordinator: the Assistant Airport Manager at Tweed-New Haven Airport will be responsible for various wildlife hazard management-related tasks and duties, including overseeing wildlife training and wildlife management operations at Tweed, and enforcement of this Plan.

Wildlife Hazard Working Group: The representatives from Tweed, USDA WS, and other necessary agencies that will take part in reviewing this Plan for any of the reasons listed in section FAR 139.337 (f)(6) of this Plan.

Wildlife Patrol Personnel: Persons to whom authority has been delegated to conduct harassment or removal of wildlife on Tweed-New Haven Regional Airport. This includes airport operations, USDA Wildlife Services, or a Private Contractor.

Wildlife Sweep: Survey of the airfield to look for the presence of wildlife.

Roles and Responsibilities: FAR 139.337 (f) (1)

A list of individuals having authority and responsibility for implementing each aspect of the plan

Wildlife Hazard Management Group

The Wildlife Hazard Management Group (WHMG) is responsible for reviewing the WHMP and providing input for the annual update of the plan. Not all members of the WHMG have a direct responsibility in the implementation of the WHMP; however, their presence ensures an airport wide understanding of the HVN Wildlife Hazard Management Program and it's associated-activities. The WHMG meets annually and is represented by:

Airport Manager

- Plays a large role in the implementation of the WHMP
- Responsible for the strategic direction of the airport WHMP

FAA APPROVED

APR 25 2016

LJD

Assistant Airport Manager

- Designated as the Wildlife Coordinator for Tweed-New Haven Airport
- Has oversight over the Wildlife Hazard Management Plan and responsible for implementing changes in the plan
- Reviews wildlife activity and logs periodically. Discusses any mitigation changes and recommendations with USDAWS

USDA WS Wildlife Biologist

- Monitor and control wildlife activity and attractants on and near the airport
- Provide operational and technical support to manage wildlife hazards
- Provide monthly reports summarizing wildlife observations and offering actions that may be taken to mitigate any identified issues
- Offer recommendations and assist in the implementation of management practices to alleviate or eliminate current, potential, and future wildlife hazards
- Ensure compliance with all applicable federal, state, and local environmental regulations regarding wildlife
- Facilitate the application of unique expertise and resources available through other USDA (WS) staff and management
- USDA WS biologist has provided the airport with a Wildlife Hazard Management Plan that was completed in December of 2009
- Facilitates the Tweed-New Haven Airport's cooperative service agreement with USDA listed in the appendices

Airport Operations

- Conduct airfield sweeps each shift and report wildlife issues to USDA wildlife biologist
- Respond to bird/aircraft strikes, gather information for FAA Form 5200-7, collect samples (as available), and submit reports to FAA strike database and if applicable, the Smithsonian Feather Identification Lab
- Disperse wildlife on the airport
- Conduct runway/taxiway sweeps and report any wildlife remains collected to USDA WS
- Attend required wildlife hazard management training provided by an FAA qualified airport wildlife biologist
- Responsible for the inspection of the wildlife perimeter fence as well as monitor vehicle movements in the AOA

Airport Maintenance

- Maintain airport property to reduce the number of wildlife attractants to the maximum extent practicable
- Report observed hazardous wildlife activity to Airport Operations
- Assist in the implementation of the WHMP through installation and maintenance of wildlife deterrents

FAA APPROVED

APR 25 2016

LJD

FAA ATCT/FAA Facilities

- Report any observed wildlife hazards to Airport Operations
- Gather information and notify pilots of any wildlife hazard on or around the airfield

While Airline/FBO Tenants do not participate in the Wildlife Hazard Management Group,

informational meetings regarding the HVN Wildlife Hazard Management Plan are held on an as needed basis. To ensure a successful management program, Airline/FBO Tenants share the following responsibilities.

Airline/FBO Tenants

- Ensure employees are aware of the wildlife program at HVN
- Assist in enforcing airport regulations regarding the feeding of wildlife, as well as any future regulations related to the management of hazardous wildlife
- Aid in directing flight crews to report any wildlife observations and hazards to Airport Operations

FAA APPROVED

APR 25 2016

Wildlife Hazard Assessment Actions: FAR 139.337 (f) (2)

Table 1: 2009 HVN WHA Priority List of Recommended Actions (f) (2)

WILDLIFE HAZARD ASSESSMENT RECOMMENDATIONS	COMMENTS	INITIATION DATE	TARGET DATE	STATUS
Continue to be aggressive in dispersing and removing hazardous wildlife		2009	Daily	Continuous
Remove abandoned equipment	Equipment and debris around the East ramp should be removed to reduce small mammal habitat	2009	Daily	Continuous
Remove large mammals	Zero tolerance for large mammals needs to be maintained	2009	Ongoing	Continuous
Grass management	Grass should be regularly mowed 7-14 inches to reduce seed production in order to reduce bird activity	2009	Daily	Continuous
Remove perches	Any large trees should be removed and place anti perching rods on the antennas and poles	2009	Ongoing	Continuous
Exclude buildings	The use of netting can be used to prevent birds from making nests. Retractable jet bridge should be removed	2009	Ongoing	Continuous
Construction of Wildlife Fence	The construction of a Wildlife Deterrence Fence will reduce large mammal population inside the airfield	2009	2014	Completed
Remove thin brushy and/or woody areas	Removal of thin brush and woody areas eliminates food and cover for all wildlife	2009	Daily	Continuous

FAR 139.337 (f) (2) (1) Wildlife Population Management

Tweed-New Haven Airport has variety of wildlife species that cause a great concern to the daily aircraft operations. The following wildlife species are the ones of greatest concern at Tweed-New Haven Airport based on the WHA that was conducted in 2009 by the USDA WS:

FAA APPROVED

APR 25 2016

LJD

European Starlings

European Starlings can form large flocks, which can range in the thousands. These birds are opportunistic feeders that can consume a variety of foods, including fruits, grains, weed, seeds, and insects. Grass height management is usually the best method of controlling populations and

serves as a long-term solution. Insect management using biological and chemical pesticides can aid in reducing Starling population.

Gulls

Gulls are commonly attracted to airports when food or water is available. Food sources may include refuse from dumpsters or nearby landfills, shellfish, earthworms, and insects. Airport infield, standing water, rooftops and light posts are ideal for loafing. Some of the effective methods to control gulls are to clean and contain trash area, prompt removal of animal carcasses from the airfield, elimination of standing water, and actively hazing and depredating.

Canada Geese

Canada Geese pose a great risk to aviation safety due to their size and also tend to travel in flocks. Geese prefer open grass where they can feed and see approaching predators. The best method for Canada Geese is the removal and exclusion of attractive habitat and agricultural crops. Pyrotechnics works well also against these birds and depredating to reinforce the pyrotechnics. Tweed-New Haven Airport practices a "zero tolerance" policy with these birds.

White Tailed Deer

The White tailed Deer is found throughout most of North America and may weigh from 50-400 pounds. Deer are generally crepuscular, active at dawn and dusk, or a nocturnal species. These animals feed on leaves, stems, fruits, nuts and agricultural crops. The most effective methods of controlling deer is exclusion by having a fence that us at least 10 feet tall with 3 wire strands. There is a "zero tolerance" on any large mammal that enters the airfield. USDA WS assists with by taking it lethally or herding it out of the airfield gates.

Crows

Crows are medium sized birds that can cause severe damage to aircraft. These birds are highly intelligent and social. Fortunately, they are somewhat adept when it comes to avoiding aircraft. This does not mean that they can be dismissed as hazard either. Managing the grass height and removing trees and roosting structures are effective methods for controlling crows. Crows are continuously dispersed and harassed using pyrotechnics and reinforced with lethal takes whenever is necessary.

Coyotes

The species of Coyote that has been observed at Tweed-New Haven Airport has been the Eastern Coyote. The Coyote resembles a medium sized German shepherd dog. A Coyote is a scavenger and will almost eat any animal or vegetable matter. They're known to hunt for rabbits and rodents. Exclusion and removal of Coyotes are the most effective methods to reduce risks. Proper fence maintenance is an important task in keeping these types of wildlife out the airfield. Any holes dug are quickly filled and a large section of our fence line has buried chain link skirts. Any sight of Coyotes prompts Airport Operations to contact WS for lethal take removal.

FAA APPROVED

APR 25 2016
LJD

FAA Part 139.337(f) (2) (2) Habitat Modification

2.2 Habitat Management:
Habitat management is the best long-term method for reducing wildlife hazards and bird strikes on or near an airport. Removing or modifying existing attractants such as food, water, and cover, the numbers of animals that pose a hazard to aircraft can be reduced. Care must be taken to manage habitat types in a manner that does not create new wildlife attractants or new wildlife problems. The goal is to try and make the airport less attractive to the species that are of greatest hazard to aircraft. Trained wildlife biologists have identified bird species using the airport and a habitat management program is used to discourage the birds that cause the most risk to aircraft. This may require the habitat to be managed in different ways at different times of the year depending on the species present.

2.2.1 Vegetation:
In general, the airport's current grassy areas are mowed regularly to maintain a WHA recommended height of 7-14 inches. Tweed Maintenance will be responsible for these mowing operations, as well as maintaining the fence line. The strategy allows easy visibility of birds and other hazards on the airfield, and prevents the grass from going to seed, which would attract more seed-eating birds and small mammals. The grass at Tweed-New Haven Regional Airport is mowed from spring through fall, with the first mowing activities beginning when the ground is firm enough to allow equipment access and sufficiently long to merit cutting. This grass-management scheme will be followed for all areas of the airfield with the following six exceptions:

Airport Maintenance will be responsible for clearing vegetation on both sides of the fence line, dependent on the weather. Vegetation at the fence line is part of exterior checks and a priority list item for wildlife mitigation. In preparation for operations to regrow grass, Tweed has consulted with USDA WS on which grass seed and it has been determined to be any variation of tall fescue.

In locations within wetlands, the access corridor has been reduced on one or both sides such that the access corridor only allows for clearing and vegetation removal via the use of small equipment and on foot. In upland areas, trees have been cut, the stumps ground to 4" below grade and the former stump area would be seeded. Trees and overhanging branches have been trimmed in all areas of fence installation to reduce the potential attraction for wildlife to use as assistance in crossing the fence.

In wetland areas, minimal impacts have occurred from vegetation removal and fence installation. In wetland areas, low bearing pressure (tracked) equipment was used to access the fence. Poles were pile-driven. All vegetation has been cut flush to the ground. Long-term vegetation management will occur within wetland areas along the fence corridor and will be conducted in a similar manner as initial removal using the least impacting methods. Clearing will be conducted with mowers, chain saws, line trimmers, by hand or with herbicides. This fence has been in place since the end of the calendar year 2013.

FAA APPROVED
APR 25 2016
LJD

Terrain improvements have been made at Tweed from the Runway 2/20 safety area construction. During this construction, the drainage canals of both safety areas were rerouted through the perimeter of the airfield. Two holding ponds were created in the safety area of Runway 20.

These shallow holding ponds are attractive bodies of water to waterfowl and wading birds. A portion of the drainage canal at the approach of Runway 20 was buried. The shallow stream that remains open is very attractive to waterfowl and wading birds due to the gradual slope of the ground, its proximity to short grass, and the long reeds and cattails used as cover for predatory wading birds.

2.2.2 Wetlands:

Intertidal and freshwater wetlands encompass much of Tweed, as shown in Figure 1, including one large contiguous wetland system that borders on or drains into Morris Creek. Wetland habitats present include tidal and freshwater marshes, freshwater scrub/shrub, and wooded swamp plant communities. Most of the wetlands lie to the west, east, and south of Runway 2/20. The wetlands to the south and west of Runway 2/20 were rehabilitated during the WHA to repair drainage canals, and to attempt to reduce the amount of *Phragmites* in the wetland. The flow of tidal waters into these wetlands is under the control of Tweed by means of a gate system. This was designed to increase the salinity of the wetlands in order to reduce *Phragmites* in the wetland and control flooding. These salt marsh habitats are some of the most productive in the world, rivaling rainforests. Excessive *Phragmites* growth chokes the productivity of the wetland.

2.2.3 Manmade Structures and Abandoned Aircraft:

Buildings and other structures on the airport provide perching, roosting, and nesting areas for birds. Starlings, rock pigeons, kestrels, sparrows, and gulls are frequently observed in or on these structures. Buildings such as hangars provide nest sites for pigeons, house sparrows, and starlings year-round. Bird droppings and nesting materials were observed in the retractable gangways and terminal buildings. Netting has been used in some of the terminal doorways to mitigate the perching and roosting of the above-mentioned birds. A pigeon trap has also been set up on the top of the terminal and administration buildings to reduce the number of pigeons that frequent the areas. Airport Operations will monitor these man-made structures for bird activity as part of their daily wildlife patrols.

2.2.4 Wildlife Fencing:

In order to reduce the possibility of wildlife on the airfield as much as possible, Tweed has erected a wildlife deterrent fence. Construction of this perimeter fence began in January 2014 and ended in May 2014. Approximately 13,145 linear feet of fence had been installed, with an the effective height of nine feet with eight feet of vertical fence fabric and three strands of out-facing barbed wire along the top. The two locations where this fence differs is around the long-term parking lot and behind the T-hangars, which is six feet tall. In upland locations, a three-foot fabric skirt has been buried on the exterior to discourage burrowing underneath the vertical fence, while in wetland areas the fence skirt has been removed due to permitting conditions from CTDEEP, OLISP and ACOE. In order to avoid such circumstances, the fence has been constructed within a varying-width corridor of approximately thirty (30) feet to allow room for access for inspection and maintenance. Where practicable and in upland and non-wetland buffer areas, a 15-foot access road has been constructed along one side of the fence to allow for vehicle monitoring.

The location of this fence is shown on Figure 1. The fence will be monitored on an ongoing basis by Airport Operations to maintain the integrity of the fence (i.e. checking for fallen trees on the fence, dig outs from animals, or damage from the general public such as holes being cut). Any of the existing fence that was used in the creation of this new perimeter fence, has been cleared

FAA APPROVED

of vegetation on both sides to a minimum width of 10 feet on the airfield side and a minimum of 5 feet and maximum of 10 feet on the outside, where possible, unless impeded by existing structures or property boundaries. Vegetation has been cleared on both sides of the fence and will be permanently maintained in upland areas by the airport maintenance department either by using small equipment or hand clearing in order to keep the fence visible and reduce maintenance.

Laws and Regulations: FAR 139.337 (f) (3)

Federal, state and local governments administer laws and regulations that protect wildlife and their habitats. A number of laws and regulations affect wildlife management, and Tweed-New Haven Airport wildlife personnel will adhere to all applicable laws. State and federal permits are needed to operate a successful control program and will be obtained on a yearly basis by the Wildlife Coordinator or other designated official.

3.1 Federal Regulations

The U.S. Government has passed several statutes for the protection of wildlife including the Migratory Bird Treaty Act (MBTA), and the Lacey Act, the Endangered Species Act, Bald Eagle Protection Act, the National Environmental Policy Act, and the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA). These are the basis of most wildlife regulations that have been issued in the Codes of Federal Regulations (CFR). There are three sections that specifically address wildlife management: 50 CFR 10 (General Provisions), 50 CFR 13 (General Permit Procedures), and 50 CFR 21 (Migratory Bird Permits)—all are included as Appendices of the Wildlife Hazard Assessment.

Several agencies are responsible for implementing these regulations and many of these regulations affect wildlife management at airports. Federal wildlife laws are administered by the U.S. Fish and Wildlife Services (USFWS) and primarily involve migratory birds protected under the MBTA and all species protected under the Endangered Species Act.

3.2 Federal Permits

Tweed-New Haven Airport currently operates under Federal Fish and Wildlife Depredation Permit Number **MB670603-0.** This permit authorizes Tweed-New Haven Airport to kill a limited number of Canada Geese, Herring Gulls, Ring Billed Gulls, Great Backed Gulls, Laughing Gulls, Barn, Bank and Tree Swallows, American Black Ducks, Mallards, Hooded Merganser, Great Blue Herons, Great, Cattle, and Snowy Egrets, Double Crested-Cormorant, Mourning Doves, Horned Larks, Snow Bunting, Black and Turkey Vultures. Under the "emergency take" clause this permit authorizes Tweed-New Haven Airport to take any non-endangered and non-threatened species of migratory birds (such as an Osprey) when they are creating or about to create a hazard to aircraft. Tweed-New Haven Airport will exercise this option if necessary.

To avoid a lapse in permit, Tweed-New Haven Airport will maintain a current permit by submitting a written application at least 30 days prior to the expiration date of the permit (see 50 CFR § 13.22). If non-lethal harassment is not effective to reduce wildlife hazards, Tweed-New Haven Airport will seek authorization for additional species or additional takes by requesting Form 37 Migratory Bird Damage Project Report from USDA WS.

3.3 State Regulations

Connecticut State laws follow the Federal regulations for migratory bird species and further regulate actions concerning mammals and non-migratory birds (Department of Energy and Environmental Protection). The Connecticut Department of Energy and Environmental Protection is responsible for issuing state depredation permits (permits that allow for the take of birds and mammals to protect property, agriculture, and human health and safety).

FAA APPROVED

3.4 State Permits

Tweed-New Haven Airport possesses an Airport Depredation Permit, Permit Number 26-7, which is a standing permit to remove birds and mammals such as deer, coyotes and foxes. Raccoons, Opossums, and Skunks may be taken any time without a permit. Woodchucks are considered unprotected wildlife and may be also taken at any time without a permit. Tweed-New Haven Airport will request modification to species and Special Conditions on these permits as needed to accomplish other objectives in this Wildlife Hazard Management Plan.

A USFWS Depredation Permit will be kept current by the Airport Manager to allow the removal of Migratory Birds as listed in 50 CFR. USDA Wildlife Services is contacted annually to issue a Migratory Bird Damage Project Report (WS Form 37) recommending renewal of the permit and assists Tweed-New Haven Regional Airport Operations personnel in determining if any changes are warranted. Take of crows, red-winged blackbirds, brown-headed cowbirds and common grackles is covered under a Standing Depredation Order issued by the USFWS and no additional permitting is required to take these species when posing a hazard to aviation safety.

A Connecticut Department of Energy & Environmental Protection, Division of Wildlife Permit to take non-migratory birds and mammals also kept current. This permit allows for the take of deer, coyote, red and grey fox, turkey and other state managed species that pose a risk to aircraft.

Pigeons, starlings, house sparrows, Norway rats, and house mice have no federal or state protection and no permit is required for their lethal removal on the Airport.
See Appendices 1 and 2 for copies of the current depredation permits from the USFWS and the State of Connecticut.

Table 2. Wildlife Categories in Tweed-New Haven Airport and Permits for Lethal Control

Category	Species	State Permit	Federal Permit
Resident Game Birds	Turkey, Ruffed Grouse, Bobwhite Quail, Ring-necked Pheasants	Yes	No
Resident Non-Game Birds	Starlings, House Sparrows, Rock (feral) pigeons	No	No
Migratory game birds	Geese, Ducks, Snipe, Woodcocks, Rails, Gallinules	Yes	Yes
Migratory non-game birds	Raptors, Doves, Gulls, Songbirds, Swifts, Swallows, Shorebirds, Shorebirds, and Wading Birds	Yes	Yes
Depredation order birds	Crows, Red-winged blackbirds, brown headed cowbirds and Grackles	No	No
Mammals	White-tailed Deer, Black Bear, Red Fox, Gray Fox, Eastern Cottontail Rabbits, Eastern Gray Squirrels, Eastern Coyotes, Bobcats, Raccoons, Striped Skunks, Virginia Opossums, Muskrats, American Beavers, Fishers	Yes	No
Resident Non-game Mammals and Reptiles	Woodchucks, Porcupines, Red Squirrels, Snapping Turtles, Snakes	Yes	No
T & E Species (lethal & non-lethal control)		Yes	Yes
Feral/Free ranging domestic animals	Dogs, Cats, Livestock	No	No

FAA APPROVED

APR 2 5 2016

LJD

Resources to Implement Plan: FAR 139.337 (f) (4)

The Airport Operations department at Tweed is supplied with ground vehicles and pyrotechnics for use in dispersing wildlife. Additionally, some of the vehicles include after-market sirens and loudspeakers. Because Tweed employees are prohibited from using firearms, it maintains an agreement and contract with USDA WS who has its own supply of dispersal and resources to be used for lethal take. The pyro technics and launchers are stored in and kept in ATF approved containers for firearms.

Operations personnel are not equipped with any kind of pesticide or chemical to be used for wildlife control. Each Operations vehicle is equipped with appropriately stocked snarge kits. Each Operations vehicle is equipped with the following:

1. Snarge and wildlife strike report kit, including:
    a. Instructions for strike collection
    b. Field strike report
    c. Rubber gloves
    d. Small plastic bags
    e. Sterile swabs
    f. Alcohol pads
    g. Bird Identification Guide
2. Wildlife dispersal kit, including:
    a. Pyrotechnic launcher(s)
    b. Pyrotechnics ("bangers", "screamers", and primer caps)
    c. Ear and eye protection
    d. Approved ATF Container for the above items
3. A functioning horn
4. VHF and Motorola FM radio
5. Light beacon
6. Shovel
7. Broom

Procedures to be followed during air carrier operations FAR 139.337 (f) (5)

Designation of personnel responsible for implementing the procedures FAR 139.337 (f) (5) (1):

Trained Airport Operations Supervisors and Airport Operations Personnel
(Seven days per week, 24 hours per day)
USDA Wildlife Services Wildlife Biologist
(Periodic Visits, On request)

Provisions to conduct physical inspections of the aircraft movement area and other areas critical to successfully manage known wildlife hazards before air carrier operations begin FAR 139.337 (f)(5)(2):

FAA APPROVED
APR 2 5 2016
LJD

Airfield Inspections

Airport Operations personnel will monitor the entire AOA seven days per week for wildlife and attractants. Security inspections are made and include an inspection of the security fence line at

least once a week. Additionally, fence line inspections will be completed after, high winds, heavy rains, snow/ice events or any other unusual events. Inspections will be documented in the airport's Wildlife Observation and Control Log. Airport Operations personnel will conduct at least three full length inspections of each runway each day, including full-length inspections before any closed runway is reopened and after any wildlife is reported.

Wildlife Hazard Control Measures FAR 139.337 (f) (5) (3)

5.3.1 Aggressive Bird Dispersal and Removal

In reference to CFR 139.337(a) – Airport Operations will take immediate actions in addressing any wildlife hazards as they arise. Specifically, if any wildlife is observed on or in the vicinity of an active runway, Airport Operations will coordinate an immediate runway closure and will contact HVN ATC on the Local Tower frequency (124.8MHz). Airport Operations may also contact HVN ATC via the Airport Operations cell phone that is in possession of the on-duty Airport Operations Supervisor about any specific wildlife hazard details that deems the runway unsafe for aircraft operations. Prior to the Airport Operations vehicle entering the Runway(s) for dispersal and removal, the HVN ATC controller will verbally confirm that the Runway(s) is closed. The Runway(s) shall remain closed until all wildlife has been dispersed or removed to the satisfaction of the Duty Airport Operations Supervisor. Airport Operations will coordinate all other wildlife dispersals or removals on the airfield on either Ground Control frequency (121.700) or a phone call to the tower cab.

Airport Operations personnel will take an aggressive approach in dispersing birds, particularly waterfowl, gulls, crows, and starlings. Airport Operations personnel will conduct patrols several times each day during periods when European Starlings, Gulls, and Crows are likely to be present. The wetland areas and storm water channels in the airfield will be continually monitored throughout the year for the wildlife because waterfowl are routinely observed using the storm water ditches and wetlands. All birds using the storm water ditches and wetlands will be harassed with pyrotechnics until they leave airport property. The USDA WHA recommends the airport adopt a zero-tolerance policy for waterfowl (specifically Canada Geese) on the airport. During routine inspections or when observed anytime by Airport Operations personnel, Airport Operations may request for immediate assistance from USDA WS for the coordinated removal of wildlife. However, since USDA WS or private control operators are not located on the airport property 24/7, Airport Operations will attempt to harass the wildlife away from the airfield until their arrival, which can be approximately 2 hours. All wildlife observations and control measures will be logged by Airport Operations on the airport's Wildlife Observation and Control Log.

5.3.2 Large Mammal Removal

All deer, coyotes, and foxes observed inside the wildlife fence will be removed as practically as possible by either USDA WS or a private Nuisance Wildlife Control Operator. Airport Operations will maintain a "zero tolerance" policy for deer and other large mammals on the airfield because of their severe threat to aviation safety. The Assistant Airport Manager or Lead

FAA APPROVED
APR 25 2016
LJD

Operations Supervisor will notify necessary personnel when a lethal removal effort is being conducted to maintain safe shooting conditions.

Ways to communicate effectively between personnel conducting wildlife control or observing wildlife hazards and the air traffic control tower FAR 139.337 (f)(5)(4)

All Airport Operations vehicles are equipped with two-way radios for communication with the Air Traffic Control Tower. These vehicles are equipped with either a rotating or flashing beacon for visibility. All personnel assigned to these vehicles are trained in proper radio communication with the Air Traffic Control Tower and are familiar with aeronautical operations. In case of wildlife activity, Airport Operations will contact HVN ATC via the ground frequency or the FM radio and advise of the wildlife and its location. At this time, Airport Operations will ensure there is no impact to aircraft operations by communicating aircraft traffic information with the controller. After the aircraft traffic information has been verified, Airport Operations will commence harassing or depredating activities. When the harassing or depredating has been done, Airport Operations will notify HVN ATC that the wildlife dispersal has been completed. Airport Operations personnel will coordinate wildlife dispersal with the Air Traffic Control Tower as described in Section 139.337 (f) (5) (3). During non-tower hours, Airport Operations personnel will be monitoring and announcing AOA movements on CTAF frequency 124.8MHz.

Procedures to review and evaluate the Wildlife Hazard Management Plan every 12 consecutive months or following an event described in 14 CFR Part 139.337 f (6) (b)(1), (b)(2), and (b)(3)

The following are persons responsible for the review of the WHMP to be held at Tweed-New Haven Airport, and are collectively referred to as the Wildlife Hazard Management Group:

- Airport Manager
- Assistant Airport Manager
- Airport Operations Manager
- Airport Operations Supervisors
- Airport Operations Coordinators
- Airport Maintenance Supervisor

Supporting Agencies:

- Air Traffic Control Tower at Tweed-New Haven Airport
- U.S. Department of Agriculture, Wildlife Services

The WHMP will be reviewed and evaluated every 12 consecutive months or following a "triggering events" as listed below. The Airport Manager, Wildlife Coordinator, and Airport Operations Supervisors may evaluate and make changes to the plan more frequently if conditions warrant.

Triggering events that would require a review of the WHMP would include:

(1) An air carrier aircraft experiences multiple wildlife strikes;

(2) An air carrier aircraft experiences substantial damage from striking wildlife (substantial

FAA APPROVED
NOV 0 5 2018
LJD

damage means damage or structural failure incurred by an aircraft that adversely affects the structural strength, performance, or flight characteristics of the aircraft and that would normally require major repair or replacement of the affected component; or

(3) An air carrier aircraft experiences an ingestion of wildlife. In the event of a triggering event such as the ones above, the airport will review and evaluate the plan with the WHMG.

To evaluate the effectiveness of the WHMP plan in reducing wildlife strike hazards, the WHMG will be using the following procedures:

- Conduct an annual review of the WHMP to determine if changes are needed.
- Review the WHMP for consistency with airport projects, particularly those involving habitat management.
- Participate in reviews of proposed land use changes for Tweed-New Haven Airport and the surrounding area to avoid the creation of hazardous wildlife attractants.
- Provide advice for Wildlife Patrol Personnel regarding wildlife species identification, accurate data collection, proper use of control techniques, and wildlife reporting.
- Review the wildlife strike history for the past year. Any new species appearing in the strike record will be evaluated for possible control procedures and appropriate habitat modifications. Wildlife strikes with previously identified species will also be reviewed.
- Compare the wildlife strike history with summaries of control efforts. Comparing the amount of control efforts for each of those species in the strike record will assist in determining the relative effectiveness of these efforts. More specifically, it should be determined whether control efforts are targeting those species causing strikes. Any new wildlife control procedures that haven been instituted will be added, and the appropriate methodology for implementing the procedure described.
- Compare wildlife use on the airfield before and after habitat modifications. On certain areas of the airfield where habitat attractants have been modified, an effort should be made to determine if the modification resulted in a decrease, increase, or no change in wildlife use. In some cases, habitat modification may result in the location becoming attractive to another species of hazardous wildlife. In these cases, appropriate alterations of the habitat will be considered.

Wildlife Hazards Management Training Program: FAR 139.337 (f) (7)

Mandatory initial and recurrent wildlife training will be completed by all persons with responsibilities in the plan at least once every 12 consecutive calendar months. The Assistant Airport Manager will ensure that all Airport Operations personnel have undergone and completed training before engaging in wildlife control. The wildlife hazard training conducted by a qualified wildlife biologist will consist of the following:

- Airport familiarization
- Survey of wildlife hazards to aviation

FAA APPROVED
NOV 0 5 2018
LJD

- Review of strikes & control actions
- Review of WHA
- Review of WHMP
- Bird and mammal identification
- Pyrotechnics/ firearms training
- ATC communications protocol
- Description of available means of wildlife dispersal and proper technique for using them
- Familiarization with common species found at Tweed
- Familiarization with on-airport and surrounding geography with regards to what species can be expected to be seen
- Explanation of local, state, and federal laws, acts, and statutes regarding harassment and depredation of wildlife and protected species
- Familiarization with FAA definitions of "wildlife strikes" and the proper reporting and sample collection procedures

Appendix 1: Current Migratory Bird Depredation Permit

Permit Number: MB670603-0
Effective: 05/21/2018 Expires: 04/30/2019

Issuing Office:

Department of the Interior
U.S. FISH AND WILDLIFE SERVICE
Migratory Bird Permit Office
300 Westgate Center Drive
Hadley, MA 01035-0779
Tel: 413-253-8643 Fax: 413-253-8424
Email: permitsR5MB@fws.gov

CHIEF, MIGRATORY BIRD PERMIT OFFICE - REGION 5

Permittee:

TWEED-NEW HAVEN REGIONAL AIRPORT
ADMINISTRATION BLDG. - 2ND FLOOR
155 BURR STREET
NEW HAVEN, CT 06512
U.S.A.

Name and Title of Principal Officer:
FELIPE SURIEL - ASSISTANT AIRPORT MANAGER

Authority: Statutes and Regulations: 16 USC 703-712; 50 CFR Part 13, 50 CFR 21.41.

Location where authorized activity may be conducted:
WITHIN THE BOUNDARY OF TWEED-NEW HAVEN REGIONAL AIRPORT, NEW HAVEN, CT

Reporting requirements:

1) Annual Report is due with next renewal. Report forms can be found at: <http://www.fws.gov/migratory birde/mbpermits.html>.
2) Supplemental Report on the relative success of any trapping and relocation efforte per condition (K) of this permit is due with next renewal.

Authorizations and Conditions:

A. General conditions set out in Subpart B of 50 CFR 13, and specific conditions contained in Federal regulations cited above, are hereby made a part of this permit. All ectivities authorized herein must be carried out in accord with and for the purposes described in the application submitted. Continued validity, or renewal of this permit is subject to complete and timely compliance with all applicable conditions, including the filing of all required information and reports.

B. The validity of this permit is also conditioned upon strict observance of all applicable foreign, state, local tribal, or other federal law.

C. Valid for use by permittee named above

D. You are authorized to take, temporarily possess, and transport the migratory birds specified below to relieve or prevent injurious situations impacting public safety. All take must be done as part of an integrated wildlife damage management program that emphasizes nonlethal management techniques, where practical and effective. Lethal take is not to be the primary means of control. Active hazing, harassment or other non-lethal techniques must continue in conjunction with any lethal take of migratory birds. You may not use this authority for situations in which migratory birds are merely causing a nuisance.

(1) The following may be lethally taken:
- (a) FIFTY (50) EACH: Herring gulls, Great black-backed gulls, Ring-billed gulls, Laughing gulls, Barn swallows, Bank swallows, and Tree swallows;
- (b) FIFTY (50) American black ducks and Mallards, in any species combination;
- (c) FORTY (40) EACH: Horned larks and Snow buntings;
- (d) THIRTY (30) Canada geese;
- (e) TWENTY-FIVE (25) Mourning doves;
- (f) TWENTY (20) Great, Cattle, and Snowy egrets, in any species combination;

FAA APPROVED

NOV 05 2018

(g) TEN (10) Black and Turkey vultures, in any species combination;
(h) TEN (10) EACH: Ospreys, and Hooded mergansers;
(i) FIVE (5) EACH: Great blue herons and Double-crested cormorants.

State Restrictions: No species may be taken which is State listed as Endangered, Threatened or Special Concern without prior authorization from the Connecticut Department of Environmental Protection Commissioner Tel: (860) 424-3011. Included on the State list, among other species, are Peregrine falcon, Short-eared owl, Northern harrier, Upland sandpiper and Grasshopper sperrow.

E. You are authorized in emergency situations only to take, trap, or relocate any migratory birds, nests and eggs, including species that are not listed in Condition D (except bald eagles, golden eagles, or endangered or threatened species) when the migratory birds, nests, or eggs are posing e direct threat to human safety. A direct threat to human safety is one which involves a threat of serious bodily injury or a risk to human life.

You must report any emergency take activity to your migratory bird permit issuing office by **EMAILING to permitsr5mb@fws.gov or FAXING to 413-253-8424** within 72 hours after the emergency take action. Your report must include the species and number of birds taken, the method of take, and a complete narrative description of the circumstances under which you determined an emergency existed. In doing so, you shall discuss species behaviors that created the hazard or risk being addressed; location of the birds relative to the aircraft or airport operations; duration of bird presence in the area where the emergency existed; timing and amount of practical non-lethal measures attempted prior to the lethal take, as well as results.

F. You are not authorized to take Double-crested cormorants or Double-crested cormorant nests as part of management ections to reduce presumed adverse impacts of Double-crested cormorants on sport fish populations.

G. You are authorized to salvage end temporarily possess migratory birds found dead or taken under this permit for (1) disposal, (2) transfer to the U.S. Department of Agriculture, (3) diagnostic purposes, (4) purposes of training airport personnel, (5) donation to a public charity (those suitable for human consumption), or (6) donation to a public scientific or educational institution as defined in 50 CFR 10.12. Any dead bald eagles or golden eagles salvaged must be reported within 48 hours to the National Eagle Repository at (303) 287-2110 and to the migratory bird permit issuing office by **EMAILING to permitsr5mb@fws.gov or FAXING to 413-253-8424**. The Repository will provide directions for shipment of these specimens.

H. You may not salvage and must immediately report to U.S. Fish and Wildlife Service Law Enforcement eny migratory birds that appear to have been poisoned, shot, or otherwise injured as the result of criminal activity.

I. You may use the following methods of take: (1) Shotguns (1a) other types of firearms by USDA only; (2) nets; (3) registered animal drugs (excluding nicarbazin), pesticides and repellents; (4) falconry abatement; and (5) legal lethal and live traps (excluding pole traps). Birds caught live may be euthenized or trensported and relocated to another site approved by the appropriate State wildlife agency, if required. When using firearms, you may use rifles or air rifles to shoot any bird when you determine that the use of a shotgun is inadequate to resolve the injurious situation. The use of any of the above techniques is at your discretion for each situation.

J. You may temporarily possess and stabilize sick and injured migratory birds and immediately transport them to a federally licensed rehabilitator for care.

K. The following subpermittees are authorized: Employees of Tweed-New Haven Regional Airport and employees of USDA, Wildlife Services. In addition, any other person who is (1) employed by or under contract to you for the activities specified in this permit, or (2) otherwise designated a subpermittee by you in writing, may exercise the euthority of this permit.

L. REPORTING: Along with the above Annual Report, you shall annually report on the relative success of any trapping and relocation efforts undertaken pursuant to Conditions D(2) and E of this permit. Such report shall at a minimum: include the dates and species for which trapping and relocation efforts occurred, whether or not successful; specify the number of trapping attempts for each species and an the relative effectiveness described in terms of both trapping success, relocation success, and number of birds that return to the Airport once relocated.

M. Your permit encompasses two calendar years. You are required to report the take associated with each calendar year on separate annuel reports. Annual reports can be found at <https://www.fws.gov/forms/3-202-9.pdf>.

M. You and any subpermittees must comply with the attached Standard Conditions for Migratory Bird Depredation Permits. These standard conditions are a continuation of your permit conditions and must remain with your permit.

O. A "No Feeding Policy" must be in place.

Appendix 2: Current State of Connecticut Depredation Permit

Connecticut Department of
ENERGY & ENVIRONMENTAL PROTECTION

AIRPORT DEPREDATION PERMIT 26-7

April 24, 2017

Ms. Diane Jackson
Airport Manager
Tweed-New Haven Regional Airport
155 Burr St.
New Haven, CT 06512

Dear Ms. Jackson:

Pursuant to section 26-7 of the Connecticut General Statutes, I hereby appoint you and the individuals listed below as Volunteer Assistants.

This Appointment is granted for the purpose of taking wildlife within the confines of the **Tweed-New Haven Regional Airport** in order to protect public safety. The taking of wildlife shall be consistent with wildlife hazard recommendations prepared by USDA Wildlife Services and shall be subject to the following conditions:

1. USDA APHIS Wildlife Services is appointed by the Commissioner of Energy & Environmental Protection to take wildlife within the airport property.
2. Additional authorization from the Commissioner is required to take any state listed endangered or threatened species. The taking of Federally listed species or migratory birds shall he subject to Federal regulatory authority.
3. Notwithstanding the provisions of paragraph 2, the airport is authorized to take wildlife posing a threat to airport operations.
4. Wildlife may be taken during the day or at night, however, the take of wildlife is not permitted on Sundays.
5. The method of take shall be consistent with the provisions of title 26 of the Connecticut General Statues. Any person who conducts trapping activities shall comply with Connecticut trapping certification requirements and all such trapping shall he in accordance with the Connecticut trapping laws and regulations in Connecticut General Statutes 26-72 and 26-66-5. No coyotes, foxes, skunks or raccoons may be relocated.
6. In the case of an imminent threat to public health or safety, notwithstanding the provision contained in condition #4, wildlife may be taken at any time, using any method consistent with professional wildlife management principles.
7. Deer suitable for human consumption shall be donated to the Hunters for the Hungry program. Deer that are not suitable for human consumption and other wildlife may be disposed of by burial on site or at a solid waste disposal facility (landfill or incinerator) provided that authorization is obtained from the permittee.
8. Immediately upon the taking of any deer such deer shall be: a) tagged with leg tags provided hy the Department of Environmental Protection and b) field dressed and stored in a cool location. The Department of Energy & Environmental Protection's Communication Center, which operates 24 hours a day, shall be notified of the tag numher(s) used by calling (860) 424-3333.
9. An annual report of all wildlife taken shall be filed with the Wildlife Division by January 15th for the previous calendar year.
10. This appointment shall expire December 31, 2020 and may be renewed upon request.

Should you have any questions regarding this Appointment please contact Ms. Laurie Fortin, Wildlife Biologist, DEEP, Wildlife Division at (860) 424-3963 or laurie.fortin@ct.gov.

Sincerely,

Susan K. Whalen

Susan K. Whalen

Directions for FAA Form 5200-7
Bird/Other Wildlife Strike Report

1. Name of Operator - This can be an airline (abbreviations okay - UAL, AAL, etc.), business (Coca Cola), government agency (Police Dept., FAA) or if a private pilot, his/her name.
2. Aircraft Make/Model - Abbreviations are okay, but to include the model (e.g. B737-200).
3. Engine Make/Model - Abbreviations are allowed (e.g., PW 4060, GECT7, LYC 580).
4. Aircraft Registration - This means the N# (for USA registered aircraft).
5. Date of Incident - Give the local date, not the ZULU or GMT date.
6. Local Time of Incident - Check the appropriate light conditions and fill in the hour and minute local time and check AM or PM or use the 24 clock and skip AM/PM.
7. Airport Name - Use the airport name or 3 letter code if a US airport. If a foreign airport, use the full name or 3 letter code and location (city/country).
8. Runway used - Self explanatory.
9. Location if En Route - Put the name of the nearest city and state.
10. Height AGL - Put the feet above ground level at the time of the strike (if you don't know, use MSL and indicate this). For take-off run and landing roll, it must be 0.
11. Speed (IAS) - Speed at which the aircraft was traveling when the strike occurred.
12. Phase of Flight - Phase of flight during which the strike occurred. Take-off run and landing roll should both be 0 AGL.
13. Part(s) of Aircraft Struck or Damaged - Check which parts were struck and damaged. If a part was damaged but not struck indicate this with a check on the damaged column only and indicate in comments (#21) why this happened (e.g., the landing gear might be damaged by deer strike, causing the aircraft to flip over and damage parts not struck by deer).
14. Effect on Flight - You can check more than one and if you check (Other", please explain in Comments (#21).
15. Sky condition - Check the one that applies.
16. Precipitation - You may check more than one.
17. Bird/Other Wildlife Species - Try to be accurate. If you don't know, put unknown and some description. Collect feathers or remains for identification for damaging strikes.
18. Number of birds seen and/or struck - check the box in the Seen column with the correct number if you saw the birds/other wildlife before the strike and check the box in the Struck column to show how many were hit. The exact number, can be written next to the box.
19. Size of Bird(s) - Check what you think is the correct size (e.g. sparrow = small, gull = medium and geese = large).
20. Pilot Warned of Birds - Check the correct box (even if it was an ATIS warning or NOTAM).
21. Remarks - Be as specific as you can. Include information about the extent of the damage, injuries, anything you think would be helpful to know. (e.g., number of birds ingested).
22. Aircraft time out of service - Record how many hours the aircraft was out of service.
23. Estimated cost of repairs or replacement - This may not be known immediately, but the data can be sent at a later date or put down a contact name and number for this data.
24. Estimated other cost - Include loss of revenue, fuel, hotels, etc. (see directions for #23).
25. Reported by - Although this is optional, it is helpful if questions arise about the information on the form (a phone number could also be included).
26. Title - This can be Pilot, Tower, Airport Operations, Airline Operations, Flight Safety, etc.
27. Date - Date the form was filled out.

Appendix 5: Current Cooperative Service Agreement with USDA WS

WS-ER (7/17)

Agreement No.: 09015
WBS Element:

COOPERATIVE SERVICE AGREEMENT
BETWEEN
TWEED-NEW HAVEN REGIONAL AIRPORT
AND
UNITED STATES DEPARTMENT OF AGRICULTURE
ANIMAL AND PLANT HEALTH INSPECTION SERVICE (APHIS)
WILDLIFE SERVICES (WS)

ARTICLE 1

The purpose of this Cooperative Service Agreement is to cooperate in a wildlife damage management project, as described in the Work Plan to reduce the potential hazard to human health and safety, damage to aircraft, public and private property associated with wildlife strikes with aircraft and wildlife on airport property.

ARTICLE 2

APHIS WS has statutory authority under the Act of March 2, 1931 (46 Stat. 1468; 7 USCA 8351-7 USCA 8352) as amended, and the Act of December 22, 1987 (101Stat. 1329-331, 7 USCA 8353), to cooperate with States, local jurisdictions, individuals, public and private agencies, organizations, and institutions while conducting a program of wildlife services involving mammal and bird species that are reservoirs for zoonotic diseases, or animal species that are injurious and/or a nuisance to, among other things, agriculture, horticulture, forestry, animal husbandry, wildlife, and human health and safety.

ARTICLE 3

APHIS WS and Tweed-New Haven Regional Airport mutually agree:

1. The parties' authorized representatives who shall be responsible for carrying out the provisions of this Agreement shall be:

Tweed-New Haven Regional Airport:	John Picard Chairman Tweed-New Haven Airport Authority 155 Burr Street New Haven, CT 06512
APHIS WS:	Monte D. Chandler State Director, CT, MA, & RI USDA, APHIS, WS 463 West Street Amherst, MA 01002

2. To meet as determined necessary by either party to discuss mutual program interests, accomplishments, needs, technology, and procedures to maintain or amend the Work Plan (Attachment A). Personnel authorized to attend meetings under this Agreement shall be the Airport Manager of Tweed-New Haven Regional Airport or his/her designee, the State Director or his designee, and/or those additional persons authorized and approved by the Tweed-New Haven Regional Airport and the State Director.

3. APHIS WS shall perform services more fully set forth in the Work Plan, which is attached hereto and made a part hereof. The parties may mutually agree in writing, at any time during the term of this Agreement, to amend, modify, add or delete services from the Work Plan.

FAA APPROVED

NOV 05 2018

LJD

ARTICLE 4

Tweed-New Haven Regional Airport agrees:

1. To authorize APHIS WS to conduct direct control activities to reduce potential human health and safety risks and property damage associated with wildlife strikes. These activities are defined in the Work Plan. APHIS WS will be considered an invitee on the lands controlled by Tweed-New Haven Regional Airport. Tweed-New Haven Regional Airport will be required to exercise reasonable care to warn APHIS WS as to dangerous conditions or activities in the project areas.

2. To reimburse APHIS WS for costs of services provided under this Agreement up to but not exceeding the amount specified in the Financial Plan (Attachment B). Tweed-New Haven Regional Airport will begin processing for payment invoices submitted by APHIS WS within 30 days of receipt. The Tweed-New Haven Regional Airport ensures and certifies that it is not currently debarred or suspended and is free of delinquent Federal debt.

3. To designate to APHIS WS the Tweed-New Haven Regional Airport authorized individual whose responsibility shall be the coordination and administration of activities conducted pursuant to this Agreement.

4. To notify APHIS WS verbally or in writing as far in advance as practical of the date and time of any proposed meeting related to the program.

5. APHIS WS shall be responsible for administration and supervision of the program.

6. There will be no equipment with a procurement price of $5,000 or more per unit purchased directly with funds from the cooperator for use solely on this project. All other equipment purchased for the program is and will remain the property of APHIS WS.

7. To coordinate with APHIS WS before responding to all media requests regarding this Cooperative Service Agreement and activities conducted by WS under the Work Plan (Attachment A).

8. To obtain the appropriate permits for removal activities for all wildlife species that poses a threat to aviation safety and list USDA, APHIS, Wildlife Services as subpermittees. The list contains, but is not limited to Connecticut state managed wildlife species; Eastern coyote, red fox, raccoon, white-tailed deer, wild turkey, and mute swan, and federally managed migratory bird species; herring gull, great black-backed gull, ring-billed gull, Canada goose, American black duck, mallard duck, hooded merganser, cattle egret, great egret, great blue heron, turkey vulture, mourning dove, and osprey. Permits for other wildlife species will be obtained as necessary.

9. To provide an indoor working space to complete necessary paperwork.

ARTICLE 5

APHIS WS Agrees:

1. To conduct activities at Tweed-New Haven Regional Airport as described in the Work and Financial Plans.

2. Designate to Tweed-New Haven Regional Airport the authorized APHIS WS individual who shall be responsible for the joint administration of the activities conducted pursuant to this Agreement.

3. To bill Tweed-New Haven Regional Airport for actual costs incurred by APHIS WS during the performance of services agreed upon and specified in the Work Plan. APHIS WS shall keep records and

FAA APPROVED

NOV 05 2018

LJD

receipts of all reimbursable expenditures hereunder for a period of not less than one year from the date of completion of the services provided under this Agreement and Tweed-New Haven Regional Airport shall have the right to inspect and audit such records.

4. To coordinate with Tweed-New Haven Regional Airport before responding to all media requests regarding this Cooperative Service Agreement and activities conducted by WS under the Work Plan (Attachment A).

ARTICLE 6

This Agreement is contingent upon the passage by Congress of an appropriation from which expenditures may be legally met and shall not obligate APHIS WS upon failure of Congress to so appropriate. This Agreement may also be reduced or terminated if Congress only provides APHIS WS funds for a finite period under a Continuing Resolution.

ARTICLE 7

APHIS WS assumes no liability for any actions or activities conducted under this Cooperative Service Agreement except to the extent that recourse or remedies are provided by Congress under the Federal Tort Claims Act (28 U.S.C. 1346(b), 2401(b), and 2671-2680).

ARTICLE 8

Pursuant to Section 22, Title 41, United States Code, no member of or delegate to Congress shall be admitted to any share or part of this Agreement or to any benefit to arise therefrom.

ARTICLE 9

Nothing in this Agreement shall prevent APHIS WS from entering into separate agreements with any other organization or individual for the purpose of providing wildlife damage management services exclusive of those provided for under this agreement.

ARTICLE 10

Tweed-New Haven Regional Airport certifies that APHIS WS has advised the Tweed-New Haven Regional Airport that there may be private sector service providers available to provide wildlife management services that the Tweed-New Haven Regional Airport is seeking from APHIS WS.

ARTICLE 11

The performance of wildlife damage management actions by APHIS WS under this agreement is contingent upon a determination by APHIS WS that such actions are in compliance with the National Environmental Policy Act, Endangered Species Act, and any other applicable federal statutes. APHIS WS will not make a final decision to conduct requested wildlife damage management actions until it has made the determination of such compliance.

ARTICLE 12

This Cooperative Service Agreement may be amended at any time by mutual agreement of the parties in writing. Also, this Agreement may be terminated at any time by mutual agreement of the parties in writing, or by one party provided that party notifies the other in writing at least 120 days prior to effecting such action. Further, in the event the Tweed-New Haven Regional Airport does not provide necessary funds, APHIS WS is relieved of the obligation to provide services under this agreement.

ATTACHMENT A
WORK PLAN

Introduction

The U.S. Department of Agriculture (USDA) is authorized to protect American agriculture and other resources from damage associated with wildlife. The primary authority for Wildlife Services (WS) is the Act of March 2, 1931 (46 Stat. 1468; 7 U.S.C.426-426b) as amended, and the Act of December 22, 1987 (101Stat. 1329-331, 7 U.S.C. 426c). Wildlife Services activities are conducted in cooperation with other Federal, State and local agencies; private organizations and individuals.

The WS program uses an Integrated Wildlife Damage Management (IWDM) approach (sometimes referred to as IPM or "Integrated Pest Management") in which a series of methods may be used or recommended to reduce wildlife damage. IWDM is described in Chapter 1, 1-7 of the Animal Damage Control Program Final Environmental Impact Statement (USDA, 1994). These methods include the alteration of cultural practices as well as habitat and behavioral modification to prevent damage. However, controlling wildlife damage may require that the offending animal(s) are killed or that the populations of the offending species be reduced.

Purpose

This Cooperative Service Agreement continues the existing agreement between APHIS WS and Tweed-New Haven Regional Airport with effective dates of June 30, 2018 to June 29, 2019. The purpose of this agreement is to cooperate in a wildlife damage management project, as described in the Work Plan to reduce the potential hazard to human health and safety, damage to aircraft, and personal property associated with wildlife strikes.

Planned USDA, APHIS, Wildlife Services Activities

Monitoring and control of wildlife for a period of twelve (12) months. Services include up to 22 daytime site visits, between 1 and 2 visits per month, to conduct operational control of wildlife, primarily birds, creating a hazard to aviation safety. Visits may be conducted at greater or lesser frequency depending on seasonal wildlife activity, weather conditions, and the needs of the airport. Additionally, APHIS WS will conduct up to twelve (12) night time site visits to conduct operational control of wildlife, primarily mammals, creating a hazard to aviation safety on a monthly basis. Night visits will be scheduled based on wildlife activity observed on the airfield by airport operations, APHIS WS personnel, and remote cameras.

The number of day and night visits may be adjusted to better address wildlife issues and meet the needs of the airport. If additional day visits are required or requested by Tweed-New Haven Regional Airport, three (3) day visits may replace one (1) night visit. Alternately, if additional night visits are required or requested, one (1) night visit may replace three (3) day visits. If more than 22 day and 12 night visits (or combination of visits as adjusted above) are required before the agreement ends on June 29, 2019, they may be requested by Tweed-New Haven Regional Airport in writing. E-mail is acceptable. These visits will be charged at a cost of $605.50 for each day visit and $1,572.50 for each night visit requested by the airport and conducted by Wildlife Services.

Methods to be used may include, but not be limited to vehicle chasing, pyrotechnics, trapping, toxicants, firearms, remote cameras, night vision, and infrared imaging equipment. Wildlife Services will coordinate with Tweed-New Haven Regional Airport personnel when scheduling and planning control activities. Additional site visits for control may be conducted at Wildlife Services discretion, as outside funding and scheduling allow.

If the airport is contacted by media or a member of the public, the airport may, at their discretion, forward any or all of these calls to WS Amherst office so information about the program can be distributed accordingly.

Effective Dates

The cooperative agreement shall become effective on June 30, 2018, and shall expire on June 29, 2019.

NDDB Preliminary NUMBER: 202201593

Project: Airport improvements including new terminal and runway extension; Tweed-New Haven Airport New Haven & East Haven 155 Burr St., New Haven, CT

Expiration: March 3, 2023

I have reviewed Natural Diversity Data Base (NDDB) maps and files regarding this project. According to our records, there are State-listed species (RCSA Sec. 26-306) documented within the proposed project area.

Grassland Birds
State Endangered birds horned lark (*Eremophila alpestris*) and grasshopper sparrow (*Ammodramus savannarum*), State Threatened Eastern meadowlark (*Sturnella magna*), State Species of Special Concern Savannah sparrow (*Passerculus sandwichensis*) and bobolink (*Dolichonyx oryzivorus*) occur within Tweed-New Haven Airport. Please comply with any pre-existing mitigation plans prepared to protect grassland birds for your property.

The horned lark, grasshopper sparrow, Savannah sparrow, bobolink and eastern meadowlark are considered to be grassland-obligate birds. They require open fields to breed, nest and forage in. Habitats preferred by these species include large grasslands, agricultural fields, and airports.

This Preliminary Site Assessment does not preclude the possibility that species not previously reported to the Natural Diversity Database may be encountered on the site. You are encouraged to report incidental observations to the Natural Diversity Database using the appropriate survey form and follow the instructions for submittal. We recommend field surveys be conducted in order to evaluate potential habitat and species presence. Field surveys should be performed by a qualified biologist with the appropriate scientific collecting permits at a time when these target species are identifiable. A report summarizing the results of such surveys should include:

- Survey date(s) and duration
- Site descriptions and photographs
- List of component vascular plant and animal species within the survey area (including scientific binomials)
- Data regarding population numbers and/or area occupied by State-listed species
- Detailed maps of the area surveyed including the survey route and locations of State listed species
- Assessment of impact by project activities

- Mitigation recommendations for any anticipated impacts
- Statement/résumé indicating the biologist's qualifications

The site surveys report should be sent to the CT DEEP-NDDB Program (deep.nddbrequest@ct.gov) for further review by program biologists.

For your planning purposes, the following general recommendations are useful for managing grassland birds at airports:

- Ground nesting birds found nesting at airfields should not pose a threat to aircraft because of their small size and low direct flight; in addition, managing for these species by leaving some areas un-mowed during the summer can help discourage large flocking birds that prefer fields of very short grass, such as gulls, crows, and Canada geese, and are more likely to damage aircraft.
- Restrict mowing during the breeding season on portions of airfield not directly adjacent to runways and taxiways.
- Maintain 50-foot mowed strips along taxiways and runways throughout the breeding season to discourage birds from nesting in these areas. Short grasses along runways can also help reduce insect populations that can cause problems to aircraft. Other mowed strips, such as along roadways, are used by upland sandpipers and other birds for feeding.
- Observe and mark locations of nesting birds and avoid mowing those areas until birds have fledged. This may be achieved by grounds maintenance personnel.
- Burning grasslands at airfields can be used as a management tool to benefit nesting birds. Taxiways and access roads at airports provide ideal firebreaks.
- The breeding season for these birds is approximately from late April through August. It is during this period that they are most susceptible to disturbances in their feeding and nesting habitat.

During project activities, the following recommendations will help protect grassland birds:

- Land disturbance activities including digging, ground clearing, heavy machinery driving staging, or ground trampling that will occur more than 100 feet into a grassland parcel or cut across parcels of grassland in a way that fragments grassland habitat patches should be done when grassland birds are not breeding. Breeding primarily takes place between **April 15- August 15**. Conducting land disturbance activities outside of the breeding season will avoid impact to the individuals.
- Any upland grassed areas that may be disturbed, should be reseeded using an FAA-approved mix of warm season grass species including:
    - Little bluestem (*Schizachyrium scoparium*)- "Aldous" or "Cimarron"
    - Big bluestem (*Andropogon gerardii*)- "Niagra"
    - Indiangrass (*Sorghastrum nutans*)- "Rumsey"
    - Switchgrass (*Panicum virgatum*) -"Blackwell", "Shelter", or "Cave in Rock"
    - Bermudagrass (*Cynodon dactylon*) -"Quickstand"
        - Seed mix ratios are variable, however for Connecticut a minimum of 60% little bluestem is preferred. Big bluestem is an acceptable alternative to little bluestem for the dominant species in the chosen mix. When one of the

bluestems is the dominant species the other grass species listed may be mixed in any ratio desired. Of these species, Burmudagrass is the least favored and should be used in the lowest percentage.

If schedules for planned work must occur **within breeding bird areas during the breeding season** apply the following protection measures to minimize impact to state listed birds:

- The proposed construction staging area and associated vehicles and equipment should be restricted to existing paved areas as much as possible.
- Beginning April 1- through duration of project: All grassy areas within a 50 foot buffer of planned work remain continuously mowed as short as possible to avoid attracting nesting birds into work zones.
- If vehicle access is required to cross grassy areas outside of work zones, designated paths and areas should be marked and kept mowed beginning April 1. Do not drive outside of designated work areas into grassy habitat, nesting birds will be crushed.
- Identify locations on the property where grassland habitat will remain unmowed between April 15- August 30 to mitigate for lost habitat during construction. These areas must provide adequate conditions for upland grassland habitat. Provide a map detailing these grassland mitigation areas to NDDB (deep.nddbrequest@ct.gov).
- Any upland grassed areas that may be disturbed during the course of the project, should be reseeded using an FAA-approved mix of warm season grass species as described above.

Natural Diversity Data Base information includes all information regarding critical biological resources available to us at the time of the request. This information is a compilation of data collected over the years by the Department of Energy and Environmental Protection's Bureau of Natural Resources and cooperating units of DEEP, independent conservation groups, and the scientific community. This information is not necessarily the result of comprehensive or site-specific field investigations. Consultations with the NDDB should not be substituted for on-site surveys required for environmental assessments. Current research projects and new contributors continue to identify additional populations of species and locations of habitats of concern, as well as, enhance existing data. Such new information is incorporated in the NDDB as it becomes available.

Please contact me if you have any questions (shannon.kearney@ct.gov). Thank you for consulting with the Natural Diversity Data Base and continuing to work with us to protect State-listed species.

Sincerely,

/s/ Shannon B. Kearney
Wildlife Biologist

From Robin Blum provided via email 4/25/2024
Notes – CT Grassland Bird Habitat Conceptual Plan
Submitted by Hoyle and Tanner to DEEP April, 2024

Memo includes:
Page 1
"it is understood that the area in question of 23 acres was intended to be comprised of the approximately 500'X1000' RW 2 Safety Area and the 500'X1000' RW 20 Safety Area. Permits IW-2000-116, DIV-200003052 and WQC-200003051 also have conditions relating to grassland habitat and planning."

Page 1
Describing the 2008 Plan:
"Notably, the 23-acre RSAs that were planted with warm season grasses were identified as, to address FAA requirements, being mowed between heights of 4-6 inches."

Page 2
Addressing the 2011 update
Further coordination with FAA resulted in a supplement to that plan, dated April 2011 that was developed in response to the continued wildlife hazard issues that the airport was facing as documented in their Wildlife Hazard Management Plan (Attachment 2). Specifically, areas that were initially identified as non-safety or non-critical areas that could be mowed once annually and not before September 1, were shifted to allow for mowing as needed to prevent seed growth and heights at which the grasses could be used for food or cover. This was in response to several wildlife hazard incidents, and ***it is crucial to future efforts that all parties recognize that the airport currently continues to follow this supplemented plan and mows all grassed areas as needed to keep grasses between 7"-14" to reduce the potential for grasses to attract wildlife, including grassland birds. See the Grassland Management Plan that has been updated to reflect this (Attachment 3).***

NDDB comment –

- The above-referenced Attachment 2 is the 'Updated Grassland Management Plan' and not the Wildlife Hazard Management Plan. It appears the Wildlife Hazard Management Plan documentation from this 2011-ish time period is not included in this package.
- The April 2011 'Updated Grassland Management Plan' (or supplement) included as Attachment 2 (referenced above as Attachment 3) consists of a memo provided to DEEP OLISP program. The memo references the airport's Wildlife Hazard Management Plan (this plan was not included with the memo), notes that wildlife hazard incidents have increased, and states that these increases have been managed through hazard plan implementation. The memo states that when wildlife attractants are deemed at a high level, non-critical safety areas abutting critical safety areas are mowed. When deemed at an acceptable level, the mowing regime in the 2008 plan is followed. Specifically:
  Minor deviations from the 2008 plan (mowing procedures in non-critical safety areas) have been deemed necessary in the last 18 months…. These occasions have been dealt with as exceptions to the plan and have not permanently altered standard operating procedures. Further and potential deviations will be handled on a case by case basis and will be managed with sensitivity towards the goals and objectives of the 2008 Grassland Management Plan.

- Was this change forwarded to the Wildlife Division?
- Was a copy of the Wildlife Hazard Management Plan provided to DEEP?
- Was detailed information regarding the increase in wildlife hazard incidents provided to DEEP?
- Hoyle and Tanner states that the airport currently continues to follow the supplemented plan and mows all grassed areas as needed to keep grasses at 7-14". Hoyle and Tanner offers that the 'updated Grassland Management Plan' reflects this. However, the current Hoyle and Tanner statement does not seem to match the intent of the supplemented plan, which states deviations from the plan are considered exceptions and they have not permanently altered standard operating procedure, and that further and potential deviations will be assessed on a case by case basis.

Page 2:
The FAA's FONSI for this project, dated December 2023, includes a requirement that the current Grassland Management Plan be updated, and that the airport maintain compliance with that plan.
NDDB comment – is Hoyle and Tanner currently working on this update to the Grassland Management plan? When is a draft version expected? Is this document considered the update to the Grassland Management Plan?

Page 2:
Describing existing grassland habitat
To date, as shown in the figures provided in Attachments 5 and 6, the areas around Runway 2 and Runway 20, including the corresponding RSAs and Taxiway Bravo that are currently managed grassland habitat are as follows:

Area	***Currently***	***Proposed Impact***	***Total after Completion***
Runway 20	*11.6 acres*	*1.5 acres*	*10.1 acres*
Runway 2 and TW B	*23.1 acres*	*4.1 acres*	*19 acres*
Total			***29.1 acres***

There is additional grassland habitat in areas between the taxiways and runways and along the length of both runways that is not included in this accounting exercise as this was designed to specifically address this prior permit condition, however, it is worth noting that the total area of grassland habitat within the airport is significantly higher than 23 acres.
NDDB comment –

- Attachments 5 and 6 do not delineate the areas which were originally planted, nor what was originally considered critical vs non-critical/non-safety but is now being mowed per the new management plan of 7-14". A map should be provided indicating where, if anywhere, the original Grassland Management Plan is being followed, since the 2011 update was indicated to be only on a case-by-case basis (as opposed to the table in the 2016 Wildlife Hazard Management Plan, which indicated that continuous mowing of all areas had been occurring since 2009). This map should incorporate the areas of disturbance of the current project as well.

Page 2

As noted in the EA and confirmed in the FONSI, while the construction of the proposed development will reduce grassland habitat within the airport, it will not significantly affect local or regional populations of wildlife species because those found on the Airport are mobile and adaptable to transition in adjacent habitats. Furthermore, the Project would adhere applicable conservation recommendations from CT DEEP as per their NDDB Preliminary Determination letter dated March 3, 2022 (Attachment 7) that notes that the applicant must comply with pre-existing mitigation plans prepared to protect grassland birds. The applicant feels like the site is currently, and will in the future condition, be in compliance with the existing permit requirements.

NDDB comments:

NDDB cannot make a finding of no impacts to listed species based on the fact that grassland bird species are mobile. Estimated habitat loss is approximately 5.6 acres.

Regarding NDD Preliminary Determination condition that notes the applicant must comply with pre-existing mitigation plans – This condition was written based on the information contained in the 2008 Grassland Management Plan. If considering the 2011 revision/supplement (NDDB has not been able to confirm that this was provided to NDDB), that still leaves NDDB with the impression that the 2008 mowing regime is the SOP and that the need for exceptions are evaluated on a case by case basis. This seems to conflict with information provided by the Wildlife Hazard Management Plan, as well as information provided in the April 2024 submission. Therefore, that statement, while applicable and appropriate, does not appear to be what is happening at the airport.

Page 3

Proposal to conduct grassland bird surveys

This survey would be offered as mitigation for the loss of grassland habitat due to the proposed development.

NDDB comment – NDDB welcomes grassland bird survey work to help inform current bird use of the airport grassland habitat. However, NDDB survey work and information gathering does not constitute mitigation for loss of habitat. There are no actions proposed to address the loss of habitat, nor is there any discussion of potential actions that could be taken based on potential survey results.

Page 3

Methodology:

NDDB comments: The methodology for the proposed surveys is appropriate...The first survey must be completed during the last two weeks of May, with follow-up surveys spaced by at least one week.

Attachment 4 – 2016 Wildlife Hazard Management Plan

Page 19-9, Table 1

WILDLIFE HAZARD ASSESSMENT RECOMMENDATIONS	COMMENTS	INITIATION DATE	TARGET DATE	STATUS
Grass management	Grass should be regularly mowed 7-14 inches to reduce seed production in order to reduce bird activity	2009	Daily	Continuous

NDDB comment: It appears from this documentation that the grassland mowing height has been regularly maintained at 7-14" since 2009, one year (and the first growing season?) after the implementation of the 2008 Grassland Management Plan.

Page 19-11

In general, the airport's current grassy areas are mowed regularly to maintain a WHA recommended height of 7-14 inches. Tweed Maintenance will be responsible for these mowing operations, as well as maintaining the fence line. The strategy allows easy visibility of birds and other hazards on the airfield, and prevents the grass from going to seed, which would attract more seed-eating birds and small mammals. The grass at Tweed-New Haven Regional Airport is mowed from spring through fall, with the first mowing activities beginning when the ground is firm enough to allow equipment access and sufficiently long to merit cutting. This grass-management scheme will be followed for all areas of the airfield with the following six exceptions:

NDDB note: the six exceptions do not include locations where grassland seed plantings occurred.

Depredation permit notes:

- Federal depredation permit allows take of horned lark but also notes that take of any State Listed species requires prior authorization by DEEP.
- State depredation permit notes additional authorization from Commissioner required to take state listed species. State depredation permit also notes that the airport is authorized to take species posing a threat to airport operations.

Questions and comments:

- If, since 2009, mowing has occurred as described in the 2016 Wildlife Hazard Management Plan, then it would seem that the 2008 Grassland Management Plan has not been followed beyond the planting/seeding. **Is this correct?**
- The 2011 Grassland Management Plan update/memo states that the Airport is mowing in accordance with the 2008 plan, but that minor deviations have been deemed necessary. These deviations have been dealt with as exceptions and have not altered SOP. Potential future deviations will be handled on a case-by-case basis. This information provided in 2011 is contradicted by the Wildlife Hazard Management Plan, which indicates that SOP since 2009 has been to mow to 7-14", and to mow regularly over the growing season.

  Hoyle and Tanner Grassland Bird Habitat Conceptual Management Plan dated April 8, 2024 references the 2011 update. Hoyle and Tanner state that the 2011 update was drafted to address continued hazards, and states that the airport currently follows the updated plan and mows all grassed areas as needed to keep grass between 7-14". This seems to be a contradiction of the 2011 supplement which notes that exceptions will be managed on a case-by-case basis.

Please confirm that the airport is mowing to 7-14" as standard operating procedure and therefore is not following the 2011 update.

NDDB Request Additional Information
Project: Tweed New Haven Airport Runway Extension and Terminal Expansion
Filing ID 107828

Dear Ms. Coon,

As described in the NDDB review application, this project will involve the rehabilitation and extension of Runway 2-20, and the construction of a new east side passenger terminal and associated runways, parking lots, aprons and taxiways.

The following species have been documented within the vicinity of the work to be conducted:

Plants

- Yellow thistle (*Cirsium horridulum*) – State Endangered
  - Habitat: Coastal grasslands; airports; open-canopy trailsides and roadsides; inner salt marsh borders; *Juniperus-Panicum virgatum* communities, scrub communities, and forest edges bordering salt marshes.
  - Blooms June – July.
- Saltpond grass (*Leptochloa fusca ssp. fascicularis*) – State Endangered
  - Habitat: Coastal, in brackish ponds and shores of "salt ponds", borders of salt and brackish marshes, sandy depressions in coastal grasslands and sandy roadsides that are flooded by the highest mesohaline or polyhaline spring tides of the year. Populations found inland growing along highways are not believed to be of native Connecticut provenance.
  - Blooms and fruits August – November.
- Field paspalum (*Paspalum laeve*) – State Threatened
  - Habitat: Mostly near the coast, extending inland in the Connecticut River towns only as far as Cromwell and Glastonbury, and disjunct as a historic in Franklin. Hydric to moderately well drained fields, meadows, grasslands, floodplain grasslands and meadows, thickets, and shores, seasonally flooded and exposed open-canopy vernal pools. Utility ROWs, airports near the coast. Tolerant of mowing, at least at some sites. Critical Habitats include: Alluvial Grassland/Outcrop; Grassland Subtype: Coastal Grassland.
  - Fruits August – October.
- Two-flowered Cynthia (*Krigia biflora*) – State Threatened
  - Habitat: Dry to wet meadows, fields, rocky woods, and roadsides.

    - Blooms Jun.
- Hoary plantain (*Plantago virginica*) – State Special Concern
    - Habitat: Dry acidic or basic, rocky, sandy, or gravelly soil. Pastures, grasslands, floodplain levee and stream bank forests, roadsides, low traprock outcrops in old fields, calcareous (high-pH) open woodlands, dry fields, gravel banks, traprock ridges. Critical Habitats: Subacidic Rocky Summit/Outcrop; Subacidc Rocky/Summit Outcrops (probably); Floodplain Forest, High Floodplain Subtype; Dry Circumneutral Forest.
    - Blooms/fruits May – June. Spring and early summer ephemeral, typically disappearing by late June.

State listed plant species surveys of the site should be performed by a qualified botanist or plant ecologist when these target plant species are identifiable. You may want your botanist to contact the NDDB program directly for more information regarding known plant locations. The report summarizing the results of such surveys should include:

1. Survey date(s) and duration.
2. Site descriptions and photographs, and photographs of any state listed plant species found.
3. Descriptions of the identifying characters of the target listed species.
4. List of component species within the survey area (including scientific binomials).
5. Data regarding population numbers and/or area occupied by state listed plant species.
6. Detailed maps of the area surveyed including the survey route and locations of state listed species.
7. Habitat descriptions of the area surveyed.
8. Survey results and all observed state listed plant species must reported to the NDDB Program using an NDDB form at: https://portal.ct.gov/DEEP/Endangered-Species/Contributing-Data
9. If state listed plants are found within the project area or immediately adjacent to the project area, the report should include a conservation/protection plan with the following elements:
    a. Anticipated impacts to these state-listed species from this project.
    b. Any planned mitigation or management practices that will be employed to protect, avoid, and/or mitigate impacts to state listed plant species.
10. A Statement, CV or Resume of the botanist's or plant ecologist's qualifications to work with these species. Please ensure that your botanist or plant ecologist holds appropriate scientific collector's permit for this work.

Grassland Birds

- Grasshopper sparrow (*Ammodramus savannarum*) – State Endangered
- Horned lark (*Eremophila alpestris*) – State Endangered
- Eastern meadowlark (*Sturnella magna*) – State Threatened
- Bobolink (*Dolichonyx oryzivorus*) – State Special Concern
- Savannah sparrow (*Passerculus sandwichensis*) – State Special Concern

The Project is expected to impact 5.6 acres of grassland habitat.

NDDB received an application to review this project in 2022 (NDDB Preliminary Assessment 202201593). Our preliminary assessment letter included information for the above-referenced grassland bird species, including general recommendations for managing grassland birds at airports and noted that field surveys are

recommended. The preliminary assessment also instructed that the airport should comply with any pre-existing mitigation plans prepared to protect grassland birds on the property. NDDB did not receive any communication in response to the Preliminary Assessment and closed that review on March 3, 2023.

NDDB was provided a copy of the *Grassland Bird Habitat Conceptual Plan*, dated April 8, 2024; this document was prepared to address prior permitting requirements for grassland habitat within the airport boundary, document existing grassland habitat, and to propose a study of bird use and functionality of existing grassland habitat at the airport. Through review of this plan, NDDB concluded that changes to conditions outlined in the original 2008 *Grassland Management Plan* had been made in 2009 and 2011; specifically, beginning in 2009, the mowing regime agreed to in that plan was no longer being followed. NDDB provided comments responsive to this *Grassland Bird Habitat Conceptual Plan* via email on April 25, 2024.

Following the meeting between DEEP staff and Tweed-New Haven Airport representatives on April 29th, 2024, it was made clear that there is no remaining suitable grassland habitat on the property due to the mowing regime adopted in 2009. NDDB has been informed that the changes were implemented in response to airport hazard assessment and are not likely to be revised.

The *Grassland Bird Habitat Conceptual Plan* proposes to conduct grassland bird survey studies in order to understand grassland habitat conditions and use of the property. As NDDB has indicated via email comments and during subsequent meetings, NDDB welcomes this survey work as a valuable source of information, and we concur with the survey protocols proposed. However, survey work and information gathering alone does not constitute mitigation for loss of habitat resulting from project activities.

We have included the protection measures here as a reference in the event that it is deemed possible to allow habitat to regenerate on the property in the future. Barring that, these guidelines can be used as a starting point in the development of an off-site mitigation plan, as it seems unlikely that negative impacts to listed grassland bird species neither have been nor will be able to be minimized on the airport property. Since impacts to grassland birds have already been committed and earlier plan mowing regimes are not able to be implemented, **off-site mitigation should be pursued**.

Grassland Bird Protection Measures

The horned lark, grasshopper sparrow, Savannah sparrow, bobolink and eastern meadowlark are considered to be grassland-obligate birds. They require open fields to breed, nest and forage in. Habitats preferred by these species include large grasslands, agricultural fields, and airports. The breeding season for these birds is approximately from late April through August. It is during this period that they are most susceptible to disturbances in their feeding and nesting habitat.

To avoid impact to these species:

- Land disturbance activities including digging, ground clearing, heavy machinery driving staging, or ground trampling that will occur more than 100 feet into a grassland parcel or cut across parcels of grassland in a way that fragments grassland habitat patches should be done when grassland birds are not breeding. Breeding primarily takes place between April 15- August 15.
- Conducting land disturbance activities outside of the breeding season will avoid impact to the individuals.
- **Conduct project work between August 16- April 14.**

- Any upland grassed areas that may be disturbed during the course of the project, should be reseeded using an FAA-approved mix of warm season grass species including:
  - Little bluestem (*Schizachyrium scoparium*)- "Aldous" or "Cimarron"
  - Big bluestem (*Andropogon gerardii*)- "Niagra"
  - Indiangrass (*Sorghastrum nutans*) - "Rumsey"
  - Switchgrass (*Panicum virgatum*) - "Blackwell", "Shelter", or "Cave in Rock"
  - Bermudagrass (*Cynodon dactylon*) - "Quickstand"
- Seed mix ratios are variable, however for Connecticut a minimum of 60% little bluestem is preferred. Big bluestem is an acceptable alternative to little bluestem for the dominant species in the chosen mix. When one of the bluestems is the dominant species the other grass species listed may be mixed in any ratio desired. Of these species, Bermudagrass is the least favored and should be used in the lowest percentage.

If work cannot occur between months of August 16-April 14:

- The proposed construction staging area and associated vehicles and equipment should be restricted to existing paved areas as much as possible.
- Beginning April 1- through duration of project: All grassy areas within a 50-foot buffer of planned work remain continuously mowed as short as possible to avoid attracting nesting birds into work zones.
- If vehicle access is required to cross grassy areas outside of work zones, designated paths and areas should be marked and kept mowed beginning April 1. Do not drive outside of designated work areas into grassy habitat, nesting birds will be crushed.
- Identify locations on the property where grassland habitat will remain un-mowed between April 15 - August 30 to mitigate for lost habitat during construction. These areas must provide adequate conditions for upland grassland habitat. Provide a map detailing these grassland mitigation areas to Robin Blum (robin.blum@ct.gov).
- Any upland grassed areas that may be disturbed during the course of the project, should be reseeded using an FAA-approved mix of warm season grass species as described above.

Your request has been assigned the following number: **107828; please include this number on all correspondence regarding this request**.
Responsive information should be sent to:

Kim Peace
Hoyle, Tanner and Associates

Re: NDDB Filing 107828 – Runway Extension and Terminal Expansion. Summary of documents received to date and outstanding issues.

Kim,
In order to facilitate progress on the NDDB review for the above-referenced project, I have prepared the following list of documents and associated comments provided to NDDB thus far.

03/06/2024 – NDDB review request submitted
05/20/2024 - Technical RAI letter issued

Documentation provided to NDDB to date:

- NDDB Application material
- Grassland Bird Habitat Conceptual Plan
- Bird survey report
- Proposed on-site mitigation proposal

Note: Plant survey work is on-going and results have not yet been provided to NDDB.

<u>Grassland Bird Habitat Conceptual Plan</u>
Components:

1. Narrative summarizing history of grassland management and associated projects, proposal for grassland bird survey work.
   The narrative states that "There is additional grassland habitat in areas between the taxiways and runways and along the length of both runways that is not included in this accounting exercise as this was designed to specifically address this prior permit condition, however, it is worth noting that the total area of grassland habitat within the airport is significantly higher than 23 acres."
   NDDB is of the understanding that these areas, along with other grassland areas at the airport are subject to regular mowing from spring through fall (per the WHMP), and therefore does not function as habitat for grassland nesting birds.
2. Original 2008 Grassland Management Plan (prepared as part of permitting requirements associated with project activities)
   Grassland mowing language:
   …..non-critical operational areas disturbed in conjunction with RSA and taxiway improvements only are expected to be mowed once annually, with mowing anticipated to occur in the late summer/early fall, but under no circumstances prior to September 1st during any given year….
   Depending upon climatic and vegetative growth conditions, however, an early spring mowing also may be implemented, but under no circumstances later than April 15th during any given year.
   Mapping included.

The Plan notes that the goal of grassland management must be carefully balanced with the airport's primary goal of maintaining aviation safety.

3. 2011 Supplement to the 2008 plan. Developed in response to the continued wildlife hazard issues that the airport was facing as documented in their Wildlife Hazard Management Plan (year?). This document consists of a memo provided by Tweed Airport to Kevin Zawoy.
   - Non-safety critical areas – mowing limited as much as practicable without allowing wildlife attractants to increase the frequency of potential bird strikes. However, in the event an increase in wildlife attractants … non-critical safety areas that abut critical areas are mowed. Conversely, when wildlife attractants are deemed to be at an acceptable and safe level, non-critical safety areas are mowed in accordance with the Grassland Management Plan.
   - … the airport wishes to inform CT DEP that minor deviations the 2008 plan (mowing procedures in non-safety critical areas) have been deemed necessary in the past 18 months to maintain safe airfield operations. These occasions have been dealt with as exceptions to the plan, and have not permanently altered standard operating procedures. Further and potential future deviations will be handled on a case by case basis and will be managed with sensitivity towards the goals and objectives of the 2008 Grassland Management Plan.
4. Updated maps
5. 2016 Wildlife Hazard Management Plan
   Table 1 indicates that, since 2009, grass has been regularly mowed 7-14"

WILDLIFE HAZARD ASSESSMENT RECOMMENDATIONS	COMMENTS	INITIATION DATE	TARGET DATE	STATUS
Continue to be aggressive in dispersing and removing hazardous wildlife		2009	Daily	Continuous
Remove abandoned equipment	Equipment and debris around the East ramp should be removed to reduce small mammal habitat	2009	Daily	Continuous
Remove large mammals	Zero tolerance for large mammals needs to be maintained	2009	Ongoing	Continuous
Grass management	Grass should be regularly mowed 7-14 inches to reduce seed production in order to reduce bird activity	2009	Daily	Continuous

   Section 2.2.1 states that in general, the airport's current grassy areas are mowed regularly to maintain a WHA recommended height of 7-14 inches…The grass at Tweed-New Haven Regional Airport is mowed from spring through fall, with the first mowing activities beginning when the ground is firm enough to allow equipment access and sufficiently long to merit cutting.

NDDB notes that the mowing regime outlined in 2008 was modified in 2011 to be addressed on a case-by-case basis. This is contradicted by the 2016 Wildlife Hazard Management Plan, which states that regular spring through fall mowing began in 2009.

Wildlife Division was not notified of the mowing regime change described in this 2016 Wildlife Hazard Management Plan. Additionally, it remains unclear when this mowing regime was implemented – per WHMP, it was initiated in 2009, but this predates the 2011 update to the 2008 Grassland Management

Plan. Finally, NDDB can find no documentation that the submitted 2008 revision was ever approved by DEEP.

Bird Survey Report
Savannah sparrow documented on the property.

Proposed on-site mitigation map
Received by NDDB earlier this week. NDDB requests additional detail regarding this proposal; once received, NDDB will review and provide feedback.
High level concerns:

- In order for this to be taken under consideration, an appropriate mowing regime will need to be followed in perpetuity. It cannot be considered if the airport is unable to make this commitment.
- This will be reviewed only in conjunction with impacts from the current project and will not be sufficient to mitigate for deviations from earlier agreed-upon mowing regimes in other sections of the airport.

Next steps:

- As noted above, NDDB request additional detail regarding proposed on-site mitigation. Please describe the current state, proposed grassland habitat restoration and management activities, and proposed mowing regime. NDDB will review that material and provide feedback.
- Ongoing discussion – mitigation needed for mowing regime changes. An assessment of impacts resulting from mowing regime changes is needed in order to determine mitigation requirements. NDDB will work with Hoyle and Tanner to outline steps needed to make that assessment.
- Plant survey results will be provided to NDDB as available.

---

Kimberly,
I think it would be good for me to clarify how mitigation works for wildlife and plants; it does not follow a formula the way you may be used to for some wetland projects and as you've outline proportionally below.

When we look at mitigation for grassland birds, we need to consider the natural history needs of the birds. They are not simply using a six-acre patch of grass. These birds need to find large open areas to even consider nesting—that is considered the "attraction area" or what it takes for them to even consider using a habitat block for nesting. The birds perceive the habitat as the entire airfield. If mitigation can occur on site, the balance of airfield is still available as that attraction area. Once you move offsite, you must provide a large enough attraction area to get them to even look at a site. The further you are from the original location or from a known population, the larger the area needs to be. This attraction area varies by grassland species. For upland sandpipers, it is 100 acres; grasshopper sparrows typically need 50 acres; species like Savannah sparrow are a bit more flexible and can make use of block in the 25 to 30-acre range. It is also about finding sites that are large enough for them to safely nest. Smaller blocks are much more susceptible to nest failure and we cannot accept mitigation areas that essentially become population sinks.

We have used the same process for all grassland bird mitigation projects for many decades. One example is the stadium at Rentschler Field. Much like Tweed, on site mitigation was not possible, the offsite mitigation area was not nearby, and while in the migratory flyway for the target grassland species, it did not have current nesting. It also had all three of the species I mentioned above. In that case, the offsite mitigation area was 200-acres and included a significant habitat enhancement component.

There has been extensive research on the habitat requirements and minimum acreage thresholds for grassland bird species. This chart created by Mass Audubon for their 2017 publication on *Best Management Practices for Grassland Birds* is a handy quick reference. Savannah sparrows fall between the requirements of bobolinks, the most tolerate of grassland obligates, and grasshopper sparrows, a close relative of Savannah sparrows.

Minimum field size (acres) for six grassland birds in the Northeast

For the reasons noted above, we will be looking for a minimum of 25 acres for offsite mitigation and may require more if the habitat needs enhancement, part of the soils are excessively wet, or areas of the parcel are not favorable for nesting by this species for some other reason. Please note that we will require documentation of current species use of the mitigation area to consider minimum acreage proposals.

If you have any additional questions, please let me know.

Jenny

Hello Robin and Jenny- while we understand the complexity of comparing mitigation plans for different species, we do need to have a more defined rationale behind CTDEEP's requirements to satisfy FAA requirements for providing funding for these mitigation activities. As discussed currently:

Off-site: 25 acres preservation/enhancement: 4 acres of grassland impact is a 6.25:1 ratio.
On-site: 6 acres of grassland creation: 4 acres of grassland impact is a 1.5:1 ratio.

Do you have comparable projects in CT where these ratios were required, or data on savannah sparrow that would justify these numbers?

Additionally, we completed a preliminary field assessment at the Warren site on Friday and the CTDEEP-approved ornithologists from eDesign identified savannah sparrows as currently using the site, see photo. We will follow up with the required species documentation form.

We are preparing a Draft Compensatory Mitigation Plan for the Warren site that will propose a mix of preservation and enhancement/restoration recommendations to enhance the conditions for savannah sparrow while protecting habitat for the state-listed kestrel.

Thank you-

Subject: RE: [External] RE: Tweed Airport RW Extension and Terminal - grassland mitigation

Hi Kim,
Regarding your question below (yellow highlight), the answer is a bit nuanced.

Given species requirements, 25-30 acres of grassland habitat would be suitable to meet the savannah sparrow needs and therefore sufficient for the impacts to species documented on the Tweed property. NDDB would prefer larger acreage if possible, given the distance between impact location and proposed Warren mitigation site; it would be considered a positive when NDDB is assessing the mitigation proposal. However, any proposed management intended to increase grassland acreage for grassland birds should not come at the expense of American kestrel documented to be nesting on the property. As assessment of the Warren property continues, keep in mind that NDDB would like to see as much acreage as possible for grassland birds balanced with the needs of kestrel and other listed species that may be on the property.

I hope this is helpful, and I understand that Tweed is reconsidering onsite options. Let me know if you have any questions.
Robin

Hi Robin, this is good news for our team- we look forward to further discussion on Monday. Can you please provide comment on the resumes that were sent for the eDesign team staff that will be assisting us in responding to the questions provided and developing a plan for the site? We would like approval of them soon so that we can move this work forward.

An important question still unanswered is the ultimate acreage to be provided- Robin you stated in the prior meeting that you felt like a 25-30 acres area of grassland habitat would be sufficient goal to offset the 5.6 acres of grassland habitat on the airport that will be paved as a result of the runway extension, in light of the avian surveys identifying Savannah sparrow as the primary target species. Please provide confirmation that this is the acreage goal - we recognize that this acreage would need buffer areas such that ultimately the parcel would be slightly larger than this.

Thank you-

Kimberly Peace

Subject: [External] RE: Tweed Airport RW Extension and Terminal - grassland mitigation

Hello Kim,
Please accept my apologies for the delay in responding. We have reviewed the MIH document and additional information regarding the proposed Warren property for off-site mitigation and offer the following feedback.
We will consider the parcel for off-site mitigation. The distance from the area of impact is a concern, but, if the proposed parcel can provide the correct habitat for the target species, and can incorporate appropriate ongoing habitat management, then distance from impact site will be less of a concern.

In order to further evaluate the parcel, we need detail regarding the following:

- How wet is the soil, does the soil allow for creating and maintaining the same type of grassland habitat as found in the airport impact area?
- When is the field hayed?
- As noted in your email below:
    - details regarding proposed management relative to creating/improving the parcel for the target bird species
    - Who will own the property and/or hold the easement?
    - Who will be responsible for managing property access?

Finally, NDDB has documented occurrence of breeding American kestrel on the property. Please address how habitat management for the target bird species will avoid negatively impacting kestrel habitat needs.

Note: NDDB does not have record submissions for bobolink, alder flycatcher, purple martin on this property. If those observation records are available, please have them submitted to the NDDB via the special animal survey form.

I expect we can have further discussion on this at Monday's meeting.
Thanks very much,
Robin

EXTERNAL EMAIL: This email originated from outside of the organization. Do not click any links or open any attachments unless you trust the sender and know the content is safe.

Hello Robin, Jenny and Jeff-

As a follow-up to our meeting this week regarding the potential use of the Warren site for off-site grassland mitigation:

1. Robin stated she has concerns regarding the distance from the airport. Please let us know as soon as possible if this site is a viable option, or if it is rejected based on location.
2. If this site is deemed too far from the airport, please provide some future site search parameters for how far the site could be located. Land values increase substantially as you go farther south towards the airport, as you are aware, and are only part of the costs to completing the mitigation process.
3. If we have to find a different site, please provide the targeted acreage of grassland habitat to be developed/maintained on that desired site. Robin you stated in the meeting that you felt like a 25-30 acres area of grassland habitat would be sufficient goal to offset the 5.6 acres of grassland habitat on the airport that will be paved as a result of the runway extension, in light of the avian surveys identifying Savannah sparrow as the primary target species. Please provide confirmation that this is the acreage goal - we recognize that this acreage would need buffer areas such that ultimately the parcel would be slightly larger than this.
4. If this site is not deemed too far to be viable:
    a. we will pull in our team of grassland habitat experts from eDesign who will do an on-site evaluation into existing site conditions and a late fall avian survey – Robin I will vet their resumes and experience with you before they hit the field.
    b. they will work with us to develop a Management Plan for submittal to CTDEEP review that would include details on creation of additional grassland within the site by altering existing vegetation and soils, supplementing or restoring areas of current grassland that may not be suitable for long-term grassland growth with soils and plantings, and identification of steps to future monitoring, including

invasive species management and prevention of woody vegetation growth.

c. monitoring time frames and success criteria will also be established.
d. the Plan would also outline steps in the short and long-term that need to happen in order to obtain property control, including possible future management transition through a conservation easement with an NGO, likely Joshua's Trust, including commitment letters from parties involved.

I will be out of office next week. If you could please reply all with your response to these questions, we can keep this important piece of the permitting process moving forward.

Thank you-

Subject: HVN - onsite grassland mitigation

Good morning Tom-

The FAA team has discussed the use of the 8.9 acres on airport property as potential grassland mitigation for the savannah sparrow. While the FAA does not feel the conversion of the area to grassland would be a wildlife hazard, we are concerned that giving up the parcel for aeronautical use may create restrictions on an airport that is experiencing growth. The FAA would like the Authority to thoroughly consider this option and its implications for aeronautical expansion. After you've considered the options, please let us know your intent in writing.

Sincerely,
Cheryl Quaine

Sarah Barnum (BSC) *sbarnum@bscgroup.com*
Amanda DeCesare (WSP) Amanda.decesare@wsp.com

Meeting Objective: Monthly discussion with relevant permitting agency staff regarding permits for the project. *Agenda items in italics.*

1. *Wetland Mitigation*
    - *Draft Plans currently showing conservative 9.72 acres inland wetland impacts*
    - *Wetland Mitigation Plan drafted and under internal review: field data collected has been analyzed, proposed restoration approach and adaptive management strategies identified, additional wetland delineations occurred and reporting to be finalized*
        - *Adjustments to tide gate operations to allow flooding of marsh with saline water up to 2.5' elevation and retention of water levels for up to 6 hours*
        - *Tide Gate operational changes to current programming of SCADA system*
        - *Prior to storm events, tide gate will be switched to Watershed Drain Mode to allow for adjustments to prevent flooding of adjacent properties*
        - *Scheduled mowing 2X/yr, early summer and late fall, and removal of Phragmites biomass*
        - *Consistent monitoring by wetland scientist and adaptation as needed*
        - *Adaptive Management Plan- to be based on how close to coming to meeting Performance Standards, to include, in stepwise fashion: herbicide application to*

Phragmites, extended elevated water level duration, excavation of tide channels, manual excavation of Phragmites and addition of sand and plantings of Spartina.

- *Tide gate tested to determine operational approach is viable – confirmed, minor tide gate changes may be needed to obtain water levels to reach goals*
- *Financial commitment requirements and process to be discussed.*
- ***DEEP notes:*** Wetland mitigation 9.72 acres – wetlands 4, 5, 6 – wetlands mitigation study is in review internal with Hoyle Tanner. Plant species were not found in tidal mitigation areas.
- Adaptive Management plan is step wise - Phragmites inundation study shows that the salt marination will be possible with the tide gates. May need minor repair to tide gates. Removing phrag with mowing and removal, and, finally, herbicide.
- Financial mitigation commitment requirements – **set up separate meeting with USACE and DEEP and Tweed.** Federal jurisdiction is only for 5-6 acres, wetlands 4 &5. DEEP discourages submittal of incomplete applications because the 401 times out in one year.

2. *Grassland Mitigation*

- *Impact has been revised to approx. 4 acres*
- *On-site Mitigation deemed not viable*
- *Grassland Mitigation Plan in development for Off-site mitigation via Warren parcel*
- R. Blum stated they are waiting on receipt of additional site information to review for confirmation as to the adequacy of the off-site mitigation parcel, K. Peace stated she will work with eDesign team to provide.
- **DEEP Notes:**
- 4 acre impact- On-site mitigation was not deemed feasible.
- Warren Parcel – have delineated separate ecosystems on the parcel – grasslands, wet meadow, vernal pool, swamp, etc. Robin reminds that there are questions about the soils and Wildlife hasn't signed off on the suitability of this parcel yet. Will need management plan and conservation approach for the property. Hoyle will be providing two documents Grassland Mitigation Plan and the Tidal Mitigation Plan. **Side meeting with Elsa (consultant) and Robin - asap**
- Hoyle has collected seeds as part of Plant Mitigation Plan. Working with Native Plant Trust.
- Fisheries – working with Bruce Williams. Hoyle sent additional information. – Will want side meeting. 3 species in NDDB review are not actually present in the Morris Creek area. Restoring tidal flows to marsh will have benefits to fish resources. **Tide gate meeting – Kimberly will reach back out.**

3. *NDDB/Listed Plant Species*

- *Identified Paspalum within inland field wetland*
- *Seeds collected to be included as piece of Plant Mitigation Plan.*
- R. Blum asked if we have been coordinating with the Native Plant Trust since they are short staffed, and if we have difficulties to let her and Bill know. K. Peace stated she will check with BSC and keep CTDEEP informed.
- *Fisheries coordination initiated for species identified as potential within tidal mitigation area*

- B. Williams stated the three state-listed species on the NDDB report for the tidal mitigation areas will not be affected by the tidal mitigation project, and restoring tidal flows to the tidal marsh not likely to impact fisheries, however he would like to discuss the project further w/K. Peace in regard to non-listed fish species review and requested additional information on the tide gate operational changes. K. Peace will coordinate that.

4. *FEMA/CLOMR/Stormwater*

- *CLOMR Process reviewed and initiated.*
- *FEMA pending 2025 LOMR estimated to be issued January.*
- *Design drawings sent to CTDEEP/FEMA and comments received re: increase freeboard of terminal.*
- *Terminal design currently being revised to address requirement for BFE+2 conservative.*
- ***DEEP Notes:***
- FEMA/ CLOMR/ Stormwater - coordinating with New Haven and East Haven to sign CLOMR application. **Will submit to FEMA in January.**
- Terminal design being adjusted to be BFE +2. (Requirement is +1).
- FAA has jurisdiction for NEPA. USACE provides comment on FAA's NEPA decision. 404B1 is USACE's analysis to permit the least environmentally damaging alternative. Hope that the preferred options in NEPA aligns with 404B1.

5. *Schedule*

- *Design for RW and Terminal in progress, current design submittal 12/11*
- *Expected permit application submittal week of 12/16*

- J. Caiola expressed concern over receiving an incomplete application and meeting a 6-month review time. Once the application is submitted, it becomes public record and a part of the freedom of information act (FOIA) so the public can receive a copy of the application and comment on it as well as get their own specialists to refute any aspects of it. If the NDDB, etc. are approved ahead of time, it allows staff to focus more on the review process and will reduce receiving any comments/questions from the public about aspects of the application that haven't been officially approved by CTDEEP. J. Caiola can put a hold on reviews of any state project but he cannot put a hold on federal projects so if the application is submitted without the normal mitigation plans, etc. approved, it can add time to the review process and the public hearing process.
- L. Robbins stated they would typically not review an application without CTDEEP Determination number.
- Suggested that coordination with CTDEEP Wildlife to receive a Determination, and with CTDEEP Wetlands staff to receive confirmation on wetland mitigation plan, before submitting permit application would be better since any information submitted with the permit application will become available under FOIA and could be rebutted by public. CTDEEP staff will also have to take time to respond to FOIA requests that will take away from time reviewing the application.
- C. Fontanella said she is working with Tom Cavaliere and Andrew King responding to public information requests, to address Environmental Justice and to prep for adjudication.
- J. Caiola stated the 401 Water Quality Certification (WQC) has a federally-mandated 1 year timeline for CTDEEP to take action, he will look further into if that License can be applied for

separately from the CTDEEP Inland Wetland permit, and if the Inland Wetland Permit anticipated adequacy hearing, which may take several months or more, would also delay the WQC. If CTDEEP cannot act on the WQC in one-year, has to be denied.

- J. Caiola also stated this meeting would satisfy the WQC Pre-Filing meeting requirement.
- J. Pritts stated USACE has to have the 401 WQC and CZMA addressed before they can issue the 404 permit. The 401 WQC has to go to EPA for review for at least 30 days, and then possibly for 60 more days to neighboring states if there is a "may effect" determination. USACE cannot start the 404 review until the 401 is received from CTDEEP per 404b1.
- For USACE a mitigation statement could be used for public notification process.
- If further tide gate operations will be discussed with B. Williams, J. Caiola stated he and other permit specialists from CTDEEP will want to be included.
- **DEEP Notes**:
- See Sue Jacobson's notes. Added below for convenience
- *Design for RW and Terminal in progress, current design submittal 12/11*
- *Expected permit application submittal week of 12/16*
- Wetland and grassland mitigation plans have not yet been finalized. DEEP staff recommend holding off on application submission until the plans have been reviewed and conceptually approved by LWRD and Wildlife Division staff. When staff receive the applications with completed mitigation plans, public inquiries will be less time consuming. (The public will request copies of the application and an incomplete application will cause confusion.)
- Final NDDB Determination. L. Robbins stated they would typically not review an application without a final NDDB Determination. The final NDDB Determination would most likely include the grassland mitigation plan.
- 401 Water Quality Certification (WQC). J. Caiola expressed concern over receiving an incomplete application (without mitigation plans finalized) and meeting a federally-mandated one-year WQC review time. While state program applications can be placed on 'hold', the 401 cannot. The WQC would be denied if the state could not meet the one-year deadline. The Structures, Dredging and Fill and 401 applications do not need to be submitted and processed simultaneously. It was suggested that the WQC application not be submitted until the SDF application was ready for public notice. (This submission delay is common for Dam Safety and WQC applications.) J. Caiola stated this meeting would satisfy the WQC Pre-Filing meeting requirement.
- 404 WQC. J. Pritts stated USACE has to have the 401 WQC and CZMA addressed before they can issue the 404 permit. The 401 WQC has to go to EPA for review for at least 30 days, and then possibly for 60 more days to neighboring states if there is a "may effect" determination. When the Corps receives the application, they publish their notice if the application is complete or not. A mitigation statement could be used for this public notification process. (However, the state needs their applications to be complete prior to their public notice.)

- Public participation. A hearing request is anticipated. While most applications can be reviewed within a year, a hearing would impact this standard timeframe. Freedom of Information Act requests are also anticipated. The submission of complete applications will be less confusing to the public and generate less documentation for the hearing record.
- C. Fontanella said she is working with Tom Cavaliere and Andrew King responding to public information requests, to address Environmental Justice and to prep for adjudication.

- If further tide gate operations will be discussed with B. Williams, J. Caiola stated he and other permit specialists from CTDEEP will want to be included.

6. **Action Items:**
    1. **Camille will coordinate meeting regarding financial assurance with relevant parties from USACE and CTDEEP**
    2. **K. Peace will coordinate with B. Williams re: Fisheries Coordination, set up meeting, provide additional info on tide gate operations.**
    3. **Hoyle Tanner will coordinate with New Haven and East Haven for required signatures for the CLOMR application, anticipated January submittal.**
    4. **Hoyle Tanner will let CTDEEP and USACE know if permit submittal timeline will shift.**
    5. **Agreement on next monthly meeting Monday Dec 30, 2024. CTDEEP will have answer by then on how to proceed with WQC and timeline in regard to the anticipated adequacy hearing.**
    6. Side meeting with Elsa (consultant) and Robin Blum - asap

Re: FW: [External] NDDB 117005 Tweed Tide Gate Management - clarification needed

Subject: RE: [External] NDDB 117005 Tweed Tide Gate Management - clarification needed

Good morning,

I have listed our comments for the Grassland Bird Mitigation Plan below. If you have any questions that I can potentially address before Monday's meeting, please let me know.

As discussed last week, while we feel that the proposed Grassland Bird Habitat Mitigation Plan is most of the way there, we do have some comments and tweaks.

1. First, most pressingly, we would like impacts to Brown Thrasher (*Toxostoma rufum*) addressed in the report. Brown thrasher is already documented at this site and nests in shrubby habitat, utilizing shrubs, thickets and brush (especially hedgerows adjacent to open fields: a habitat type that is currently present on the property). According to the mitigation plan, invasive plants and woody vegetation will be removed within the designated grassland habitat, and saplings and shrubs will be removed along forest edges. We cannot approve measures to benefit one listed species at the expense of another.
2. We would like to see follow-up bird surveys conducted annually beginning in spring 2028 (two mowing/growing seasons after the mitigation work and adaptive management begins) through the end of the five-year mitigation plan to assess grassland bird usage of the habitat. We would expect the results of the bird surveys to be presented to NDDB no later than August 31, so that we can have time to review and comment on them before the year's adaptive management plan is finalized and put into play. These surveys would be in addition to the Annual Vegetation Surveys conducted during the September 1 – October 15 period of each fall.
3. The following mowing regime recommendations should be implemented in order to ensure no impacts to listed species already present.
    a. We would like to see a 1/3 – 1/3 – 1/3 mowing pattern within the grassland as opposed to the ½ - ½ proposed. This would allow for a more natural progression of habitat as well as maintain a truer habitat mosaic for the benefit of all species present which utilize the grassland.
    b. Avoid vehicular traffic from May 15 – September 15. Any access to the site during this period must be by foot.
    c. Mowing style: Avoid flail mower heads with guide bars that ride along the ground. Sickle bar mowers will have the least impact. In areas with more woody vegetation >1-2" diameter, Brontosaurus-style mowers will likely have the least impact on wildlife.
    d. Directionality – Start mowing from the center of the field and use a back-and-forth approach, or large circular pattern, to avoid concentrating fleeing animals where they may be killed or stranded. In addition, leave an unmowed 30 ft strip around the perimeter of the field and mow this area last.

i. If field is near stream: start mowing the side furthest from stream and work towards stream.

ii. If field is bordered by woodland: start mowing side furthest from woodland and work towards woodland.

iii. If field is bordered by road, start mowing next to the road and work your way across field.

e. Mower Speed – Mowing in low gear or at slow speeds will allow wildlife to react and move out of the field.

3. Finally, we would like to bring Joshua's Trust to the table to discuss ongoing vegetation management following the ownership conveyance in order to ensure that the grassland habitat is not overtaken by invasive/woody species after they begin managing the property. Mowing alone will not prevent this conversion.

Best,

Anna Toledo

Re:	Results – 2024 Tweed New Haven Airport Grassland Bird Survey		

cc:

Survey Summary

CTDEEP, Wildlife Division, has indicated that for the proposed runway and terminal improvement project at Tweed New Haven Airport, there are concerns for impacts to the following species:

- Grasshopper sparrow (*Ammodramus savannarum*) – State Endangered
- Horned lark (*Eremophila alpestris*) – State Endangered
- Eastern meadowlark (*Sturnella magna*) – State Threatened
- Bobolink (*Dolichonyx oryzivorus*) – State Special Concern
- Savannah sparrow (*Passerculus sandwichensis*) – State Special Concern

A Breeding Bird Census (BBC) conducted at the airport May 30, June 11, and June 20, 2024, confirmed the presence of savannah sparrow.

Methods

A survey of grassland birds using the habitats in and around the Tweed New Haven Airport was conducted using a standard BBC approach[1], consisting of three visits at least one week apart during the breeding season. This approach was approved by CTDEEP. Surveys consisted of listening for and/or visually observing the birds present for five minutes at 13 designated survey points (see Attachment 1) and recording them on a data sheet. Survey points consisted of a 150 m radius plot centered on the observation point, with a minimum distance of 250m between observation points. For grassland point count surveys, survey points of a 100-meter radius plot centered on the observation point with a minimum distance of 250 meters between observation are generally recommended, but due to the shape and size of the airport, a 150 m plot provided the best coverage.

Surveys started a half hour before sunrise (between 04:48 and 04:53) and ended approximately 07:00 - 07:10. For each survey, the points were visited in the same order (13-10, 3-1, 9-8, 4-7; see Attachment 1). Each point was GPS located and care was taken that for each successive survey, the survey point was located at the same spot. The survey was conducted by someone qualified to identify New England birds by sight and sound, and the species recorded for the survey may have been identified by sight, sound, or both. Although a BBC type survey is intended to record the individual birds present in a location only once per survey repetition, birds do move and there is some potential that some individuals were counted twice.

Results

Surveys were conducted on May 30, June 10, and June 20. Weather conditions during the survey are summarized below, in Table 1. A total of 42 species and 579 individuals were recorded over the course of the three surveys. The species most commonly recorded were red-winged blackbird, European starling, and common grackle, all of which commonly use grassland habitats and often flock. The only target species recorded was the savannah sparrow. This

[1] Ralph, C. John; Sauer, John R.; Droege, Sam, technical editors. 1995. Monitoring Bird Populations by Point Counts. Gen. Tech. Rep. PSW-GTR-149. Albany, CA: Pacific Southwest Research Station, Forest Service, US. Department of Agriculture; 187 p.

species was recorded the southerly portion of the airport on all survey repetitions, variously at Survey Points 5, 10, 11 and 13 on May 30, Survey Points 6 and 13 on June 11, and Survey Point 11 on June 20. (Attachment 1). Two separate individuals were recorded at Survey Point 13 on June 11. In addition to the species listed above, American robin, mourning dove, and killdeer were observed within the airport grasslands. All other species recorded during the survey were either using habitats adjacent to the airport grasslands (wetlands, shrubby areas, developed areas), or were flying over the airport. One other observation of note, holes excavated into one of the of the dirt stockpiles on the inactive NW/SE runway are consistent with the size/shape of an entrance to a belted kingfisher nest, and this species was observed flying over the airport on the third survey repetition. There was no indication that these holes currently lead to an active nest.

Appendix C- Herpetological Assessment

HERPETOLOGICAL ASSESSMENT

WARREN PARCEL, EASTFORD, CT (WINDHAM COUNTY)

July 2024

Prepared for Joshua's Trust by:

Hank J. Gruner, Herpetologist
60 Townsend Road
Andover, CT 06232

PROPERTY DESCRIPTION

The approximately 90-acre “Warren” parcel is located along Bungee Brook in Eastford, Connecticut (Windham County). The parcel consists of a mix of grassland and forested habitats and the property is currently managed for agricultural use, including, the production of hay, corn, and maple syrup. A key feature of the site is Bungee Brook and its associated floodplain which traverses the property.

SUMMARY

- The property supports a diverse array of contiguous upland and wetland habitat types that foster the potential for a high species diversity.

- Available habitat includes a high percentage of early successional stage grassland and wetland habitat types that are limited in statewide extent, and of conservation importance.

- Suitable habitat for the wood turtle, a species of high regional conservation priority currently under review for listing by the USFWS under the Endangered Species Act, occurs along Bungee Brook.

- The location of the property in relation to other protected parcels, including the Natchaug State Forest, provides an opportunity to build long-term ecological connectivity along the Bungee Brook riparian corridor.

ASSESSMENT METHODS
AMPHIBIAN AND REPTILE SPECIES OCCURRENCE

On May 24, 2024 I conducted a site walk accompanied by Bryan Avery, Land Protection Manager for Joshua's Trust, to assess the potential of habitat located on the property to support amphibian and reptile species of conservation importance. This assessment is based on a review of the upland and wetland habitats present, coupled with an analysis of wetland, surficial geology, and topographic maps, and aerial photographs of the site and its surrounding landscape.

Herpetological field surveys to detect the presence of individual species were beyond the scope of this assessment, however, the distribution and habitat use of amphibians and reptiles in the region is well-known (Klemens et al 2021). Direct observations and specimen records of amphibians and reptiles collected as part of this nearly three-decades long effort were utilized to compile species checklists based on the habitat present within, or immediately adjacent to the parcels (*see Table 1: Amphibians and Table 2: Reptiles*).

If a species was observed during the site walk it is noted as "confirmed." Specie's not observed are listed as "Probable" or "Possible" occurrence. Probable occurrence indicates that appropriate habitat is present and the species is widely distributed in similar habitat within the region. Possible occurrence indicates appropriate habitat is present, however, the species has a more restricted distribution within the region.

The species checklists are not broken down by habitat as many species of amphibians and reptiles seasonally disperse among different habitats to fulfill various life history functions such as; thermoregulation, feeding, hibernating/aestivating, or reproduction. Species checklists that are based on a broader ecosystem that encompass a diversity of inter-connected habitats are ecologically more appropriate. Where appropriate, the location of critical habitat types (e.g. vernal pools) and important species habitat associations are identified in the report narrative.

The checklists are annotated with references to individual species State conservation listings. These include, Connecticut's Endangered, Threatened and Special Concern species list (CTDEEP 2015a), and Connecticut's Wildlife Action Plan (CTDEEP 2015b). The CTWAP is currently under-going a 10-year review and changes in the listing status of some species is anticipated. Two turtles currently under review by the U.S. Fish and Wildlife Service for listing under the federal Endangered Species Act are also noted.

AMPHIBIAN AND REPTILE HABITAT

The following provides a brief discussion of the important habitat types for amphibians and reptiles on the property. *Figure 1 illustrates the approximate location of these habitats.*

Bungee Brook and Associated Floodplain Wetland Habitat

The Bungee Brook system supports a known population of wood turtles (*Glyptemys insculpta*), and the in-stream and surrounding floodplain and forested upland habitat present at the site are suitable to support over-wintering, seasonal basking, and foraging activity. Potential nesting habitat is limited to small patches of exposed sandy outwash immediately adjacent to the brook, primarily along the west bank, and sand deposits located within the confines of the brook proper. Disturbed soils associated with the corn field located in the southeast section of the property near the brook may also provide nesting habitat. It is worth noting that a small open sand pit located just to the northeast of the property on a separate private parcel may be utilized for nesting by turtles. Sand and gravel pits that are located within 1,000 feet of streams often attract numbers of female turtles due to the ideal nesting conditions created.

The wood turtle is a state-listed special concern species that is of high conservation priority in the Northeast region due to population declines and vulnerability to land use practices and changing climatic conditions (Jones et al 2015). The wood turtle is currently under review by the U.S. Fish and Wildlife Service for potential listing under the federal Endangered Species Act. This species warrants consideration in long-term planning and management of the site.

The floodplain surrounding Bungee Brook features a diversity of wetland habitats including: wet meadows, shrub swamp, forested swamp, temporary pools, and semi-

permanent channels. In addition to providing important habitat for wood turtles and a host of common species, these habitats are suitable for two state-listed reptiles, the spotted turtle (*Clemmys guttata*) and the ribbonsnake (*Thamnophis saurita*).

As a result of historic alteration (often associated with past agricultural practices) and reforestation, wet meadows, fens, and other open canopy wetlands have significantly declined in occurrence throughout the state. The property includes a high percentage of open canopy emergent wetlands, primarily associated with the Bungee Brook floodplain. These habitats warrant consideration in long term planning and management.

Inland Wetland and Vernal Pool Habitat

A small vernal pool is located within the mixed deciduous/coniferous forest along the northeastern border of the property. The pool lies within a narrow, intermittent drainage. Numerous wood frog (*Lithobates sylvaticus*) tadpoles were observed in the pool and spotted salamanders (*Ambystoma maculatum*) likely breed within the pool. Both species are obligate vernal pool-breeding amphibians. Any planned forest management should consider the presence of this pool and the community of amphibians that it supports.

The intermittent drainage area that the vernal pool lies within, as well as other intermittent streams and seepage areas within the forest, likely support populations of two stream salamanders, the dusky salamander (*Desmognathus fuscus*), and the two-lined salamander (*Eurycea bislineata*). Both salamanders are widespread throughout the region. Maintaining forest cover, and avoiding sediment input from nearby disturbance are the primary management goals for these species on the property.

A small pond draining into Bungee Brook is located east of the brook in the central portion of the property. The pond appears to be an impounded natural wetland with the placement of a culvert connecting the pond to the floodplain of the brook. The eastern portion of the pond grades into a shrub/forest swamp This wetland complex is suitable for a high diversity of amphibians and reptiles, including common species such as: the American bullfrog (*Lithobates catesbeianus*), gray treefrog (*Dryophytes versicolor*), painted turtle (*Chrysemys picta*), and northern watersnake (*Nerodia sipedon*), as well as less common species like the four-toed salamander (*Hemidactylium scutatum)*, and state-listed species, including, the spotted turtle and ribbonsnake.

Several vernal pool-breeding amphibians, including the wood frog, spotted salamander, and possibly the marbled salamander (*Ambystoma opacum*) likely breed within the shrub swamp. The vernal pool-shrub swamp breeding amphibian community should be considered as a single metapopulation for conservation and management purposes.

Upland Forest Habitat

The eastern half of the property consists of mixed deciduous (oak) – coniferous (white pine) forest. The forest provides important terrestrial habitat for many of the amphibians that utilize the vernal pool and shrub/forest swamp for reproduction, including, the wood

frog and spotted salamander. The forest also provides a contiguous dispersal corridor between the vernal pool and shrub swamp, facilitating metapopulation dynamics for the forest-wetland amphibian community. Implementing best management practices that take into consideration this amphibian community should be included for any planned forest management operations.

The forest provides suitable habitat for several species of snakes including, the red-bellied snake (*Storeria occipitomaculata*), northern black racer (*Coluber constrictor*), and northern ring-necked snake (*Diadophis punctatus*), among others. The forest-agricultural field ecotone (habitat transition zone) provides important seasonal habitat for many of these snakes.

Grassland Habitat

Approximately half of the property's acreage consists of managed agricultural fields. These predominantly consist of hay and corn crop. Corn fields provide minimal habitat value to most amphibians and reptiles. These values are limited to potential nesting sites for turtles, and the ecotonal transition habitat created between the fields and forests and/or wetlands.

Hayfields provide a much broader habitat use, especially when embedded within a matrix of forest and wetland habitats, which is the case here. They provide important early successional habitat for state-listed species including: wood turtles and smooth greensnakes (*Opheodrys vernalis*), as well as northern black racers, eastern gartersnakes (*Thamnophis sirtalis*), and pickerel frogs (*Lithobates palustrus*). Implementing best agricultural practices that take into consideration amphibians and reptiles should be considered, especially regarding mowing/vegetation management and chemical applications.

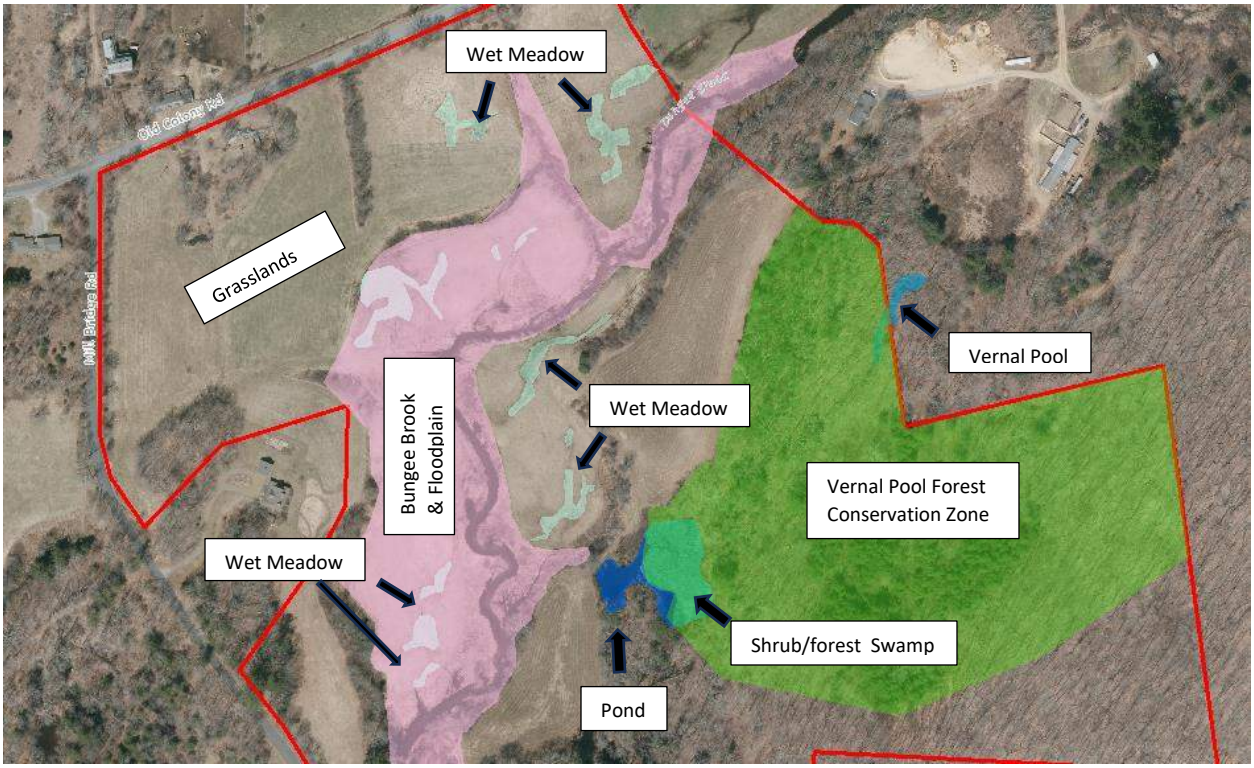

Figure 1: Bungee Brook and its associated flood plain, and upland and wetland habitats associated with amphibians and reptiles

ECOLOGICAL LANDSCAPE CONTEXT

Riparian corridors such as the Bungee Brook system, function as important ecological connectors across the landscape. Maintaining a diversity of intact terrestrial and upland habitats in association with these corridors is widely recognized as critical for maintaining ecosystem health and regional biological diversity. Long-term dispersal of individuals across the landscape is critical for maintaining the genetic health of populations, and for enabling populations to respond to changing environmental conditions. This may be especially important for the long-term viability of wood turtle populations as climate change modeling indicates that the suitability of river and stream habitat is shifting northward (Mothes et al 2020).

The property is adjacent to a significant amount of conserved land along Bungee Brook to the north. Conserving the property would further add to this acreage, and will also contribute to building ecological connectivity to the Natchaug State Forest which is located approximately 0.75 miles to the south. *Figure 2 provides an overview of the ecological landscape context of the property.*

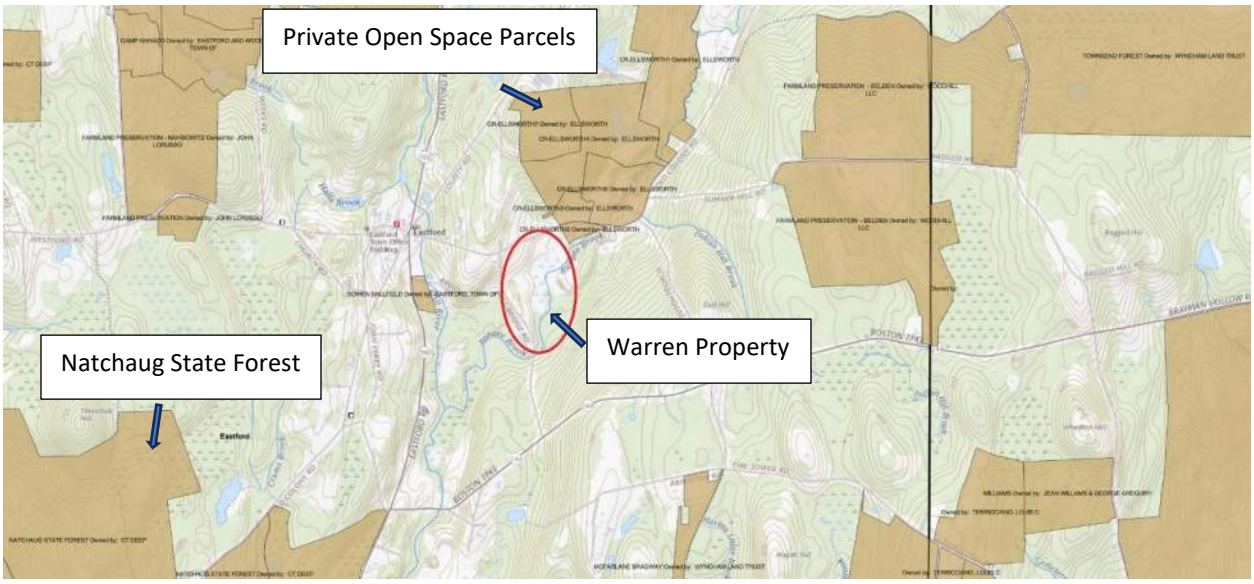

Figure 2: Location of the Warren property in relation to protected open space along the Bungee Brook system.

Based on a habitat assessment of the property and the potential occurrence of amphibian and reptile species associated with these habitats, the following three conservation priorities are recommended:

(1) Protect the ecological integrity of Bungee Brook and its associated floodplain habitat, with the wood turtle population as an important conservation target.

(2) Protect core amphibian vernal pool/wetland breeding and upland forest habitat, and maintain connectivity among these habitats.

(3) Manage the property for early successional grassland habitat, and promote the establishment of ecotonal transition habitat between the managed fields and adjacent forest and wetlands.

The following conservation and management actions are recommended to support these goals:

(1) Prevent inadvertent injury or mortality of individual wood turtles from mowing.
   a. If the primary management goal for the property is wildlife, mowing should only take place between October 15-March15, outside of the activity season (March 15-October 15).
   b. If the management goal is to balance hay production with wildlife conservation, mowing should take place between July 15-August 31 and consider the following practices
      i. Maintain a blade height of 6 inches or higher

ii. Directionally mow starting from the far edge of the field, or the field interior, and work towards the brook to allow turtles to move away
iii. Mow at a reduced speed to allow turtles to move way
iv. Maintain a 25-50 -foot buffer between from the brook/floodplain edge

(2) Employ best management practices as they relate to vernal pools/wetlands for any planned forest management applications. These should focus on protecting the vernal pool and shrub swamp basins, as well as protecting critical surrounding forest habitat, and maintaining connectivity between these wetland habitats. The following should be considered:
   a. Maintain unbroken forest connectivity between the vernal pool and shrub swamp/pond
   b. No disturbance or tree removal within 100 feet of the vernal pool or shrub swamp
   c. Maintain 50-75% forest cover in mature trees between 100-750 feet of the vernal pool
   d. If possible, conduct forestry operations during the winter months (November 1-February 15), ideally, when the ground is frozen.
   e. Fill-in or level any deep ruts created during operations to avoid creating egg deposition "sinks."

(3) Consider converting the field(s) planted in corn to hayfield or other grassland and maintain a 15-25 - foot buffer between the field and the forest/Brook.

(4) Avoid the use of pesticides as these may impact greensnakes.

Additional conservation and management recommendations that provide regional information on the habitat associations and requirements of amphibians and reptiles, possible threats to these habitats, and recommendations for managing lands in ways compatible with or beneficial to amphibians and reptiles can be found at: **Layout 1 (northeastparc.org)**

Appendix D- Letter from Conservation Biology Professor

UCONN
UNIVERSITY OF CONNECTICUT

8th August 2024

To whom it may concern:

I am writing in regard the hayfield property along Bungee Brook on Mill Bridge Road in Eastford, currently owned by Dale and Joanne Warren, and which Joshua's Trust is working to protect. Conservation interest in the site centers around the occurrence of state-listed species, potential to support additional species, and the general scarcity of protected grassland habitat in the region. Since several of the focal species are birds, I was asked by Joshua's Trust to visit the site and provide an assessment of its value.

I am a professor of conservation biology at the University of Connecticut, where I have taught conservation courses to both undergraduate and graduate students since 2003. I have lived in northeastern Connecticut for more than 25 years and have extensive knowledge of the state's birds and their conservation. For example, I am a lead investigator for the Connecticut Bird Atlas, which describes the distribution, abundance, and conservation status of all of the state's birds. I have also served on a wide variety of national and state-level committees and working groups focused on bird conservation, including those centered on grassland birds.

I visited the Eastford property on July 3rd of this year and spent several hours exploring the site. This visit confirmed the presence of bobolinks, a Species of Special Concern under the Connecticut Endangered Species Act. Bobolinks are also considered to be in trouble throughout New England due to hayfield management that routinely destroys nests and young birds. We saw several bobolinks, including at least one female that was acting in an agitated manner, indicative of a bird that had a nest in the field. The site is also clearly suitable for other state-listed bird species (e.g., American kestrel, alder flycatcher, brown thrasher), some of which have been reported on the property.

In discussing some of the management actions under consideration for the site – especially the removal of trees that bisect the fields, and sit on hilltops around the edges – it also became apparent that there is potential to attract nesting eastern meadowlarks. This potential is especially significant, as meadowlarks are one of the rarest nesting birds in the state, having suffered serious declines since the 1980s. For instance, during 4 years of statewide field surveys by hundreds of birders for the recent Connecticut Bird Atlas project, the species was confirmed to be nesting at only 5 sites in the state. Like bobolinks, meadowlark declines are associated with hayfield management, and the species is particularly vulnerable because it requires large patches of open grassland habitat. The ability to manage the site both by careful timing of any grass cutting, and by opening up the grassland via tree removal, presents a rare opportunity to benefit this species.

In addition to the benefits for rare grassland species, the combination of other habitats – wet meadow along the river, shrubby edges, etc. – will support a wide variety of other plant and wildlife species. In just the one morning I spent at the site, I saw 38 bird species – impressive given that my visit was timed quite late in the breeding season, limiting my capacity to obtain even a close-to-complete inventory of the nesting species. My understanding is that, in addition to the birds mentioned above, there are several other rare species of interest that occur at the site.

An Equal Opportunity Employer

Overall, it is clear that this is an important site to protect, and a rare opportunity to protect some key habitats that are in short supply both locally and regionally. Both the current landowners and Joshua's Trust have clearly thought hard about how to manage the site, and have a clear plan for both protecting what is already there, and enhancing the site's conservation value through management. They have also thought about ways to make the site accessible to the public (both an observation platform for birders and brook access for fishers are part of their plans), while ensuring protection of the site's key natural resources. As such, I would strongly endorse all efforts to make these plans come to fruition.

Yours sincerely,

Subject: [External] Re: Tweed Airport Grassland Management Plan, Joshua's Trust

Hi Kim and Others: In response to your recent e-mail, I'm writing to confirm that Joshua's Trust is committed to the long-term management of the grassland section of the Warren property in Eastford for Savannah sparrow and other species of interest, including management of the site via periodic mowing and invasive species control as specified in the draft Grassland Management Plan. This commitment is subject to the execution of a long-term funding plan for the program by The New HVN LLC at a level and under terms that are acceptable to Joshua's Trust.

For those not familiar with our organization, Joshua's Trust was founded as a land trust in 1966 and has been actively protecting land and promoting conservation in a 14-town region in eastern Connecticut (including Eastford) since that time. We currently protect over 142 properties comprising over 5500 acres, either by conservation easement or fee ownership. Our staff of five includes a full-time Executive Director and a Stewardship Coordinator who will be the two individuals responsible for implementing the stewardship program at the Warren property. Our staff is supported by a Board made up of conservation-minded members of the communities we serve as well as a capable team of conservation experts and contractors with whom we work regularly. We are fully accredited by the Land Trust Alliance, a testament to our commitment to responsibly maintain the conservation values of the properties that we have been entrusted with in perpetuity.

1. Executive Summary

BSC Group, Inc. (BSC) conducted rare plant surveys for species listed as state special concern, threatened, or endangered as part of an environmental review required by the Connecticut Department of Energy & Environmental Protection (CTDEEP) and the Natural Diversity Data Base (NDDB) request number 202408268, filing numbers 107828 and 117005. This survey was conducted for Tweed New Haven Airport Authority and The New HVN LLC's Runway Extension, Terminal Expansion, Tuttle Brook, and Tide Gate Alteration Area projects. The property wide survey covered 233 acres and was conducted during proper flowering windows for the target species. Surveys were conducted between June 3 – 6, September 23 – 26, and October 16 – 17, 2024. Seven plant species required surveys in locations on the airfield and in the surrounding tide marsh. Two target species were observed during the 2024 survey. One of these species, field paspalum (*Paspalum laeve* var. *circulare*), will be impacted by the proposed projects.

For the survey conducted between October 16 - 17, a vegetative community and habitat suitability assessment was conducted in the Tide gate Alteration Area to estimate the likelihood of target species presence in selected locations. In addition to habitat assessments for specific species, the survey was broadened to include any plant species within the species' genera because the survey was conducted outside of the proper flowering window for most of the target species.

Project related land conversion alterations from terrestrial habitat (pervious) to pavement (impervious) will impact an estimated 2.51% to 3.53% of the extant field paspalum population. Other non-permanent impacts, such as turf to turf conversions have the potential to impact between 52.39% - 53.25% of the extant population.

The primary mitigation strategy for field paspalum is to change existing airport revegetation protocols after disturbance events. Hydroseeding with non-native species post-disturbance is having a dramatic effect on field paspalum in various locations across the airfield. Revegetation activities will be altered to not include seeds of any type for post-disturbance revegetation efforts in rare plant locations. An estimated extensive seed bank, that includes field paspalum, exists on site and future disturbance events will encourage natural germination and provide suitable conditions for field paspalum to persist with no conflict to Federal Aviation Administration (FAA) regulations regarding vegetation management.

As a secondary mitigation strategy for this species, seed collection was approved, conducted, and completed during the mature fruiting window in November 2024. If the primary mitigation strategy fails, transplanting field paspalum plugs from contract-grown seed collected in 2024 to revegetate the site would provide mitigation post construction.

Due to an increase of 3.8 acres to the proposed tide gate alteration impact areas after the 2024 field season, this report includes presumed presence mitigation strategies for seven state-listed species. The need to implement any of the suggested mitigation strategies will be verified by BSC Botanists during the 2025 field season.

2. Project Overview

2.1 General Site Characteristics

Tweed New Haven Airport, located at 155 Burr Street, New Haven, CT covers 394 acres at an elevation of 12 feet above mean sea level and has undergone significant changes to vegetative composition over the decades. The managed airfield portion of the property, including paved runways, totals 150 acres. Although developed and managed as an airfield for the past 84 years, based on current vegetation indicates that originally it was likely a coastal grassland and shrubland habitat. The areas surrounding the developed airfield have a diversity of habitats including North-Central Appalachian Acidic Swamp, North Atlantic Coastal Plain Hardwood Forest, Emergent Marsh, Tide Marsh, and Wet Meadow Shrub Marsh. Morris Creek borders the airport property to the south, east and west and flows into Long Island Sound to the southwest. The wetlands around the airfield have been altered by ditching and water fluctuations to the wetlands in this area are regulated with the use of a tide gate on Morris Creek, located off Cart Rd. owned by the Town of New Haven.

2.2 Airport Project Descriptions

To meet various needs for expansion and safety, Tweed New Haven Airport Authority and The New HVN LLC are proposing airport improvement projects that will alter existing conditions in portions of the airfield and surrounding tidal marsh. In total, four different project areas were assessed for potential impacts to rare plant species on the airport's property. The survey areas are titled Runway Extension, Terminal Expansion, Tuttle Brook, and Tide Gate Alteration Area and correspond to NDDB's Request filing numbers. Brief descriptions of each project are below.

The Runway Extension project will extend the existing paved Runway 2-20 640' feet to the south (2.47 ac of impact.) and 366' feet to the north (1.46 ac of impact). This expansion will allow larger aircraft to use the runways as well as increase safety for use by existing aircraft.

The Terminal Expansion Project will construct a new terminal on the eastern portion of the property to replace the existing terminal. The new terminal is proposed to alter approximately 40 acres of existing airport property. Alterations within this project's footprint will consist of paved parking lots, aprons, taxiways, and access driveways as well as a new six-gate terminal.

The Tuttle Brook survey area is a 6 acres area that was assessed due to proximity to the northern section of proposed runway extension. There are no major disturbances proposed for this section of the property.

The Tide Gate Alteration Area has proposed changes to existing tide gate operations on Morris Creek to the south by increasing water levels in the surrounding wetlands by 2.5 feet affecting approximately 34 acres of marsh habitat. In addition to the original 30 acres surveyed in 2024 an additional ~3.8 acres were added and will be surveyed in 2025. This alteration to tide water levels is proposed to assist in restoration of previously altered tidal wetland habitat by reducing infestation levels of invasive common reed (*Phragmites australis*).

In addition to the converted acreage listed above for the footprints of the Runway Extension and Terminal Expansion Projects, there are approximately 72 acres of proposed turf conversion. Turf conversion areas are proposed to undergo standard grading procedures which include stripping, screening, stockpiling, grading, top-soil replacement, and finally being seeded and mulched. These grading activities will occur in many of the unpaved, vegetated airfield areas as part of both the Runway Extension and Terminal Expansion Project alterations.

2.3 Required Rare Plant Surveys

To assist Tweed New Haven Airport Authority and The New HVN LLC with the conservation of rare plants potentially present at the site, BSC conducted rare plant surveys during the 2024 growing season on behalf of Hoyle Tanner. The proposed projects will alter various portions of the airfield as well as the surrounding tide marsh areas. For the purposes of rare plant surveys, the four projects were divided into two separate groups. These rare plant surveys support permitting related to these four projects for species listed as special concern, threatened, or endangered, by the State of Connecticut.

Group 1 consists of areas within the airfield portion of the property (~200 acres) and was comprised of the Runway Extension, Terminal Expansion and Tuttle Brook portions of the project areas. Areas in this group of projects are labeled identically to Tweed New Haven Airport's existing airfield location labels 1 – 23 (**Appendix A**). Plans for the proposed airport projects in Group 1 are available in **Appendix A** and identify six different proposed land conversion types within the existing airfield: Pavement to Turf (PTT), Pavement to Pavement (PTP), Turf to Pavement (TTP), Wetland to Turf (WTT), Turf to Turf (TTT), and Wetland to Pavement (WTP).The survey effort reviewed all areas where any of these six impact types will occur.

Group 2 consists of only the tide marsh areas outside the airfield (~30 acres) that will be impacted by the Tide Gate Alteration Area project. Surveys in Group 2 targeted only areas of proposed impact. Plans for the proposed airport project in Group 2 are available in **Appendix A** and depict the approximately 30 acres of existing tidal marsh that will be inundated on a regular basis when the maximum tidal elevation is raised to 2.5 feet due to alteration of existing tide gate operations.

The largest area of impact is within the airfield area due to TTP, WTP, and TTT land conversion types. These land conversions will alter the existing habitat for rare species present at the site by either converting pervious to impervious surfaces, or in the case of TTT land conversion, by replacing existing plant communities with disturbance and application of non-native or non-local ecotype seed.

After the initial 2024 field survey season, 3.8 acres of tide marsh restoration area was added to the tide gate alteration project. Details on the 2025 field survey and presumed presence plant protection plans for the seven species is in **Section 5.3**.

3. Methods

BSC's Botanists conducted meander-based surveys of all Group 1 project areas within the airfield and in the Group 2 portions of the surrounding tide marsh that will be inundated by the alteration of tide gate operations. The surveys were conducted by qualified BSC Botanists, and staff resumes are presented in **Appendix B**.

Survey windows were selected for target species based on historical flowering data available from Native Plant Trust, digital herbarium records from Pringle Herbarium, and iNaturalist observations (**Table 1**).

Table 1. Target Species, Survey Window and Survey Location

Common Name	Scientific Name	Survey Month	Survey Area
yellow thistle	*Cirsium horridulum*	June, October	Tuttle Brook, RE/TE/TG*
two-flowered cynthia	*Krigia biflora*	June, October	Tuttle Brook, RE/TE/TG*
hoary plantain	*Plantago virginica*	June, October	RE/TE/TG*
saltpond grass	*Leptochloa fusca* ssp. *fasciculata*	September, October	Tuttle Brook, RE/TE/TG*
field paspalum	*Paspalum laeve*	September, October	Tuttle Brook, RE/TE/TG*
swamp lousewort	*Pedicularis lanceolata*	October	RE/TE/TG*
New England blazing star	*Liatris novae-angliae*	October	RE/TE/TG*

*RE/TE/TG = Runway Extension/Terminal Expansion/Tide Gate Alteration Area

3.1 Tweed Projects Rare Plant Surveys

Group 1 survey areas were divided into survey units consistent with Tweed New Haven Airport's existing location identifiers, Sections 1 – 23 (**Appendix A**). Group 2 tide marsh survey areas were uniquely labeled Phragmites Patch (PP) 1 – 17 (**Appendix A**).

During the survey, positive or negative identification of any potential target species was confirmed with plant identification keys (Haines Flora Novae-Angliae[1]), 20X hand-lens, and a measurement caliper (mm). Observed target species were recorded using an Arrow Gold RTK GNSS receiver and Samsung Tablet GPS. Single plant occurrences (low-density) were temporarily marked with a pin flag, counted, photographed and GPSed. Larger populations (medium/high-density) were estimated by approximating the total number of individuals present in a dimensional portion of the area and visually applying that density estimate across the population's extent within each survey unit. Diagnostic photos of positively identified target species as well as representative habitat were recorded with an iPhone 11 and are presented in **Appendix D**. A botanical inventory of species for both native and non-native species observed during the surveys was recorded and is presented in **Appendix C**.

All surveys were conducted from 8 am to 4 pm, over 10 days for a total of 172-person survey hours. Weather during these surveys was mostly dry and sunny with daytime temperatures that ranged from 60 – 80 degrees Fahrenheit. During each survey window, BSC Botanists coordinated with and were escorted to survey areas within the airfield by Tweed Airport staff.

[1] Haines, A., Farnsworth, E., & Morrison, G. (2011). New England Wild Flower Society's Flora Novae Angliae: A Manual for the Identification of Native and Naturalized Higher Vascular Plants of New England. Yale University Press. http://www.jstor.org/stable/j.ctt1np7h4

3.2 Tide Gate Alteration Area Project Habitat Assessment

Survey areas for the tide marsh/wetland surrounding Tweed New Haven Airport airfield were determined using eDesign Dynamics shapefiles that defined areas of future water inundation where alterations to tide gate operations will raise water 2.5 feet above existing levels (**Appendix A**). Surveys of these identified areas were conducted to determine the presence or absence of target species, as well as assess the potential for suitable habitat for these species.

The Tide Gate Alteration Area portion of this survey was conducted outside the proper flowering window for most of the target species and therefore, search images for target species were broadened to the genus level to capture any congeners as well as target species. Since target species would not necessarily be in prime identifiable condition, this overly inclusive approach assured that any potential rare species were not overlooked. Per the request of CTDEEP, general habitat suitability for the target species in the tide marsh was assessed by observation of habitat suitability in select survey locations, based on the presence and density of invasive species, light, water availability, and thickness of common reed thatch. Representative photos of each survey section for the tide gate portion of the project were recorded in addition to any areas that had markedly low densities of invasive plants (**Appendix C**).

3.3 Seed Collection Protocols

During the September 2024 survey, BSC botanists positively identified an extensive population of field paspalum in the Terminal Expansion Area. Observation of this species and the proposed impacts in the Terminal Expansion Area prompted a discussion regarding seed collection as a potential mitigation strategy.

On November 5, 2024, with permission from Tweed New Haven Airport Authority, The New HVN LLC and CT State Botanist Bill Moorhead, BSC Junior Botanist Jonathan Kuziel collected visibly mature field paspalum seeds within the Terminal Expansion Area. Seed collection efforts followed the New England Plant Conservation Program (NEPCoP) Seed Collection Guidelines for the Native Plant Trust Seed Bank[2]. Collected seeds were confirmed to species, counted, recorded, and shipped by BSC Senior Botanist, Tom Groves to Nasami Farm in Whately, Massachusetts for long-term seed storage on November 19, 2024. Confirmation and receipt of seed shipment was received from Nasami Farm November 25, 2024.

4. Results

4.1 Botanical Survey Results - Overview

Overall, 32% (46 species) of the 144 species observed and identified during June, September and October were non-native or invasive (**Appendix D**). The rare species occurrences and highest plant species diversity was observed in the open airfield area, along the edges of open habitat, and where the new terminal construction is proposed on the southeastern part of the property. Rare plant reporting forms have been submitted to DEEP via email and copies of the reports are included in **Appendix E.**

The vegetation of the tidal marsh surrounding the airfield is primarily composed of common reed, which varied in height from 15' feet tall, high-density monocultures, to 5' tall light to moderate densities. Within the salt marsh there is occasionally an upland island. The plant community composition of these upland areas is estimated to be 95% – 99% native plant species. Although these areas were outside of the tide gate alteration areas, they were noticed and noted during this portion of the survey effort. These uplands are primarily composed of an overstory of white oak (*Quercus alba*) and pin oak (*Quercus palustris*), a midstory of sweet pepperbush (*Clethera alnifolia*), and smooth arrowwood (*Viburnum dentatum*) and by sawbrier (*Smilax glauca*) in the understory.

4.2 Rare Plant Survey Results Summary

Two target species were observed during the 2024 surveys, and the observations are summarized in **Table 2** and discussed in detail below.

Table 2. Summary of Target Species and Survey Window, Effort and Results

2024 Survey Date	Botanists	Target Species	Weather	Survey Duration (Person Hours)	Summary of Survey Results	Population Estimate
June 6 - 9	T. Groves & O. Sena	*Krigia biflora* *Plantago virginica* *Cirsium horridulum*	Mostly sunny, temps in the 80s F	70	No Target Species Observed	N/A
September 23 - 26	T. Groves & J. Kuziel	*Paspalum laeve* *Leptochloa fusca* ssp. *fasciculata*	Mostly sunny temps in the 70s F	70	*Paspalum laeve* var. *circulare* *Leptochloa fusca* ssp. *fasciculata*	45,124 – 88,407 80 – 122
October 16 - 17	T. Groves & J. Kuziel	*Krigia biflora* *Plantago virginica* *Cirsium horridulum* *Paspalum laeve* *Leptochloa fusca* ssp. *fasciculata* *Pedicularis lanceolata* *Liatris novae-angliae*	Overcast /mostly sunny, temps in the 60s F	32	No Target Species Observed	N/A

4.3 Rare Plant Observations

Field paspalum (*Paspalum laeve* var. *circulare*) occurs throughout the upland and wetland portions of the airfield survey area in various densities. This species was observed in areas that will be disturbed by the Runway Extension project in Sections 1, 2, 3, 4, 6, 7, 8, and 9, Terminal Expansion Sections 10, 11, 12, 13 and 14, and Tuttle Brook Section 23 (**Appendix A**). The highest density areas of this species were observed in sections 15, 16, 17, 18 and 19. These high-density areas total approximately 19 acres and account for between 66.92% - 68.15% of the total extant population. These sections are primarily outside of the project impact limits except for 2 acres where turf to turf conversion is proposed on the western side of Section 18 (**Appendix A**).

Conservative estimates for the total population of this species in all locations across the site are between 45,124 and 88,407 individuals. Due to this species' slow growth after germination, it may take two to three years to reach maturity. Population estimates for this species have considered the potential for unidentifiable immature individuals' presence in the survey areas. All identifiable individuals were in flower or immature fruit at the time of the survey and mature fruit during the November 2024 seed collection.

No observations of field paspalum were recorded in the tide gate alteration area portion of this survey.

Saltpond grass (*Leptochloa fusca* var. *fasciculata*) was observed in two distinct locations. The first occurs in the parking area southwest of the Maintenance Building and 145 feet northwest of the continuation of Thompson Ave outside the project limits of disturbance (**Appendix A**). This plant population is estimated to be between 23 – 35 plants. The second population occurs midway on the property on an abandoned road 230 feet north of Pig Farm Road. The estimated size of this population is between 57 and 87 individuals. Neither of these areas are within the footprint of the proposed Airport projects, and therefore these plants will not experience any impact from these projects. At the time of the survey, all observed plants of this species were in immature fruit.

4.4 Field Paspalum Seed Collection

In November 2024, BNSC collected seeds as a secondary mitigation strategy for field paspalum in the Terminal Expansion project area. The seed collection effort successfully collected field paspalum seeds from 112 individual maternal lines (**Table 3**). Based on seed collection efforts, the average number of seeds collected per plant totaled 88. Based on the seed collection results and the estimated population size across the entire airport, the estimate of this population's 2024 seed production across the entire survey area is between 4 to 8 million seeds.

Table 3. Field Paspalum Seed Collection Results

Seed Collection Location	Number of Maternal Lines	Total Number of Collected Seed
Terminal Expansion Area	112	8,464

4.5 Observed Congeners

Observed congeners of target species and identifying characteristics of each species are summarized in **Table 4**. In survey locations where target species could occur, identification of any potential congener was identified to the species level. Four non-native congeners for two-flowered cynthia were observed within the airfield portion of the property, identified to species and ruled out as the target species. Slender bead grass (*Paspalum setaceum*) occurrences were infrequent but, in most cases, shared similar locations to field paspalum and was easily identified due to the slightly smaller fruits. Two congener species of yellow thistle were observed in very small populations within the area between the airfield and Morris Creek. Three congeners for hoary plantain were frequent and, in some cases, dominated the vegetation during the June survey. These other species were ruled out as the target species due primarily to a lack of pubescence on the stems and leaves (*P. lanceolata*) and bracts that conspicuously exceed the flowers and fruits (*P. aristata*).

Table 4. Observed Congener Species

Target Species	Congeners	Identifying Characteristics
Krigia biflora	*Hypochaeris radicata* (common cat's ear) *Pilosella caespitosa* (meadow hawkweed) *Pilosella officinarum* (mouse-eared hawkweed) *Pilosella piloselloides* (smooth hawkweed)	These congener species were distinguished by the cypselae beaked, the beak usually greater than ½ the length of the cypselae body to distinguish from *Hypochaeris* genus. To distinguish *Krigia* from the *Pilosella* genus, the target species is without a pappus, or with both scales and barbellulate bristles.
Paspalum laeve	*Paspalum setaceum* var. *muhlenbergii* (slender bead grass)	These congener species were distinguished by the spikelets measuring 1.8 – 2.5 mm long by 1.5 – 2 mm wide, paired at each node; with ligules 0.2 – 0.5 mm long and lower lemmas with a midvein.
Cirsium horridulum	*Cirsium arvense* (creeping thistle) *Cirsium vulgare* (bull thistle)	These similar species were distinguished from the target species by the presence of purple flowers, and capitula not closely invested by a series of narrow, spiny-marginated leaves that form a false involucre
Plantago virginica	*Plantago lanceolata (*ribwort plantain) *Plantago aristata* (bracted plantain)	Congeners for the target species were distinguished by the lack of a combination of hairy oblanceolate to obovate leaves, lobes of the corolla of carpel bearing, chasmogamous flowers erect after anthesis, closing over the fruit

4.6 Tide Gate Alteration Area – Initial Habitat Assessment

Tide gate alteration survey areas were divided into 17 units (PP 1- PP17), as depicted in the mapping provided in **Appendix A**.

During the Tide Gate botanical surveys, 50 plant species were observed, 81.25% were native (39 species) and 18.75% (11 species) were non-native or invasive. Although there was a greater number of native species, native species comprised only a small fraction of the total vegetative community observed during the survey. Common reed (*Phragmites australis*) dominates the available habitat in the Tide Gate Alteration Area and comprises an estimated 98% of the total vegetation present. **Table 5** below lists the dominant and non-dominant plant species observed at each survey location. Representative photos from each survey unit are presented in Attachment D.

There were no observations made of any target species in the tide gate alteration area during the October 2024 surveys. Due to a moderate to heavy density of common reed in this survey area, and the density of common reed thatch covering the soil, the habitat in the tide gate alteration area is unsuitable for any of the target species.

Observations of the cover type during the survey indicate that areas to be impacted by tide changes are currently 98% or more infested by common reed. Areas already experiencing more frequent tide influence currently are comprised of 99% saltmarsh cordgrass (*Sporobolus alterniflorus*). The areas currently experiencing consistent tide influence only comprise a small percentage of the total area surveyed.

Table 5. Tide Gate Alteration Survey Locations and Observed Vegetation

Location	Dominant Vegetation	Non-Dominant Vegetation
PP1	common reed (*Phragmites australis)*	climbing hempvine (*Mikania* scandens) multiflora rose (*Rosa multiflora*) poison ivy (*Toxicodendron radicans),* saltmarsh cordgrass (*Sporobolus alternifolorus*) Callery pear (*Pyrus calleryana*) small white aster (*Symphyotrichum racemosum*)
PP2	common reed (*Phragmites australis*)	climbing hempvine (*Mikania scandens)* poison ivy (*Toxicodendron radicans*) sawbrier (*Smilax glauca*) blackberry (*Rubus* ssp.) multiflora rose (*Rosa multiflora*)
PP3	common reed (*Phragmites australis*)	multiflora rose (*Rosa multiflora*) honeysuckle (*Lonicera* ssp.) groundsel tree (*Baccharis halimifolia*)
PP4	common reed (*Phragmites australis*)	groundsel tree (*Baccharis halimifolia*)
PP5	common reed (*Phragmites australis*)	saltmarsh cordgrass (*Sporobolus alterniflorus*) groundsel tree (*Baccharis halimifolia*)
PP6	common reed (*Phragmites australis*)	saltmarsh cordgrass (*Sporobolus alterniflorus*)
PP7	common reed (*Phragmites australis*)	saltmarsh cordgrass (*Sporobolus alterniflorus*) groundsel tree (*Baccharis halimifolia*)
PP8	common reed (*Phragmites australis*)	fat-hen (*Atriplex prostrata*) saltgrass (*Distichlis spicata*) saltmeadow rush (*Juncus gerardii*) groundsel tree (*Baccharis halimifolia*) Carolina sea-lavender (*Limonium carolinianum*) Virginia glasswort (*Salicornia depressa*)
PP9	common reed (*Phragmites australis*)	saltmarsh cordgrass (*Sporobolus alterniflorus*)
PP10	common reed (*Phragmites australis*)	groundsel tree (*Baccharis halimifolia*)

Location	Dominant Vegetation	Non-Dominant Vegetation
		showy goldenrod (*Solidago speciosa*) Oriental bittersweet (*Celastrus orbiculatus*) autumn olive (*Elaeagnus umbellata*)
PP11	common reed (*Phragmites australis*)	saltmarsh cordgrass (*Sporobolus alterniflorus*)
PP12	common reed (*Phragmites australis*)	poison ivy (*Toxicodendron radicans*) pin oak (*Quercus palustris*) groundsel tree (*Baccharis halimifolia*) saltgrass (*Distichlis spicata*) seaside goldenrod (*Solidago sempervirens*) shining sumac (*Rhus copallinum*)
PP13	common reed (*Phragmites australis*)	saltmarsh cordgrass (*Sporobolus alterniflorus*) groundsel tree (*Baccharis halimifolia*) woolly sedge (*Carex pellita*) swamp rose mallow (*Hibiscus moscheutos*)
PP14	common reed (*Phragmites australis*)	saltmarsh cordgrass (*Sporobolus alterniflorus*)
PP15	common reed (*Phragmites australis*)	saltmarsh cordgrass (*Sporobolus alterniflorus*)
PP16	common reed (*Phragmites australis*)	saltmarsh cordgrass (*Sporobolus alterniflorus*)
PP17	common reed (*Phragmites australis*)	saltmarsh cordgrass (*Sporobolus alterniflorus*)

5. Discussion: Impact Analysis and Mitigation Strategies

5.1 Impacts of the Proposed Projects

The proposed Runway Extension, Terminal Expansion and Tuttle Brook area projects are estimated to impact between 2.51% and 3.53% of the total field paspalum population present within the survey area. The largest impact on this population will be in the Terminal Expansion Area where approximately 40 acres of conversion from pervious surface to impervious surface is planned (WTP, TTR, WTR, WTT, and TTP) (**Appendix A**). This conversion from existing terrestrial habitat to pavement will eliminate the possibility for this species to persist in this location in the future.

Table 6 below summarizes the estimate impacts to field paspalum populations by impact type based on low and high plant number counts. TTT land conversion will impact approximately 49.72% - 49.88% of the entire population across the airport if the disturbed areas are reseeded with non-native species. During the September survey, the BSC botanist noted that areas where hydroseeding was successfully used to revegetate previously disturbed areas, field paspalum was only present in small numbers, if present at all **(Appendix D)**. Where field paspalum densities were the highest, a distinct line between previously hydroseeded areas and areas where hydroseeding either failed or was not used as a soil stabilization technique was evident (**Appendix D**).

The remaining 46.76% - 47.59% of the field paspalum population falls outside the project work limits and will not be affected by any land conversion activities.

Table 6. Field Paspalum Impact Table

Project Area*	Land Conversion Type**	Population Estimate (Low)	Impact Percentage	Population Estimate (High)	Impact Percentage
TE, RE	Turf to Pavement (TTP)	1,045	2.32%	1,533	1.73%
TE	Wetland to Pavement (WTP)	12	0.03%	28	0.03%
TE	Wetland to Rooftop (WTR)	6	0.01%	18	0.02%
TE, RE	Multiple Conversion Types	525	1.16%	645	0.73%
TE	Wetland to Turf (WTT)	3	0.01%	8	0.01%
	Subtotal	**1,591**	**3.53%**	**2,232**	**2.51%**
	Land Conversion Type*	**Population Estimate (Low)**	**Impact Percentage**	**Population Estimate (High)**	**Impact Percentage**
TE, RE	Turf to Turf (TTT)	22,425	49.70%	44,085	49.87%
TE, RE	Pavement to Turf (PTT)	8	0.02%	13	0.01%
	Subtotal	**22,433**	**49.72%**	**44,098**	**49.88%**
	Land Conversion Type*	**Population Estimate (Low)**	**Impact Percentage**	**Population Estimate (High)**	**Impact Percentage**
N/A	No Impacts***	21,100	46.76%	42,077	47.59%
	Subtotal	**21,100**	**46.76%**	**42,077**	**47.59%**
	Grand Total	**45,124**	**100%**	**88,407**	**100%**

*RE/TE/TG = Runway Extension/Terminal Expansion/Tide Gate Alteration Area
**Land Conversion Types Pavement to Pavement (PTP) and Turf to Rooftop (TTR) are eliminated from Table 6 due to PTP current state as impervious surface and TTR proposed within the footprint of other impactful land conversion types.
*** "No Impacts" is defined as an area outside of the project limits where field paspalum was observed but will not experience impacts as part of this project.

5.2 Plant Protection Plan - Proposed Mitigation Strategies

Due to the observed negative impact of hydroseeding using non-native species on the existing field paspalum population, it is recommended that seeding of any kind be abandoned as a revegetation strategy on the airfield at any location where this rare species occurs. Otherwise, TTT conversions have the potential to reduce field paspalum populations dramatically if hydroseeding with non-native species is used following the construction phase of this project. There are 8 specific locations where both TTT and PTT land conversion is proposed, and field paspalum is present. These locations (see Rare Plants Map in **Appendix A**), totaling 31 acres, will be allowed to revegetate naturally from the existing seed bank (**Table 7**). Promoting the growth of field paspalum in these areas will compensate for plants lost to the footprint of the new terminal. Based on the average seed count per individual plant collected during the 2024 seed collection, it is conservatively estimated that 4 to 8 million seeds are present across the survey area. Specifically in the proposed TTT land conversion areas, the estimate is 1.89 – 3.75 million seeds (**Table 7**). Only 1.18% of the available seed bank in these TTT areas would need to germinate to replace the number of individuals potentially lost in the Terminal Expansion Area.

Compensation for plants lost to the footprint of the new terminal can also be provided if areas where PTT conversions remove pavement are allowed to revegetate naturally. If erosion controls are required to satisfy BMPs, a biodegradable, stable, product like BioNet Biodegradable Erosion Control Blankets will be used to stabilize soil and limit erosion to meet Federal Aviation Administration (FAA) regulations without the use of non-native or non-local ecotype seed stock. These small areas of PTT conversion are proposed in Tweed New Haven Airport airfield Sections 1 – 4, 6 – 9, 14 – 15, 18, 20 – 21 and 23. The approximate size of these specific PTT conversions where rare plants occur totals 1.44 acres. Refer to **Appendix A** for maps of these locations.

To retain the seed bank present for the TTT land conversion portion of this project, segregation of topsoil in each TTT area will be necessary to retain any potential field paspalum seeds present. At the completion of construction, the topsoil will be returned to each area where grading has occurred. With the estimated number of seeds present at each location there will be enough seed present to revegetate these areas without the introduction of foreign seed material.

Future monitoring of these sites is recommended for five years to determine if natural revegetation of field paspalum is occurring in select areas where TTT land conversion disturbed the soil. If field paspalum recruitment is low in years post-construction, seeds collected during the 2024 growing season will be contract grown and transplanted onto the sites (31 acres) of previous occurrence.

Due to the number of field paspalum individuals that will be permanently impacted by land conversions in the Terminal Expansion Area, seed collection was approved, conducted, and completed during the mature fruiting window in November 2024. If the primary mitigation strategy fails, transplanting field paspalum plugs from contract-grown seed collected in 2024 to revegetate the site would provide a secondary mitigation measure post construction. In the Terminal Expansion Area, the number of field paspalum individuals permanently impacted by the various land conversion types represents 2.51% - 3.53% of the total population present across the entire survey area. Seed collection activities from the Terminal Expansion Area are estimated to be 3.7X to 5.3X the number of plants represented by the potential taking of this species (**Table 7**).

Monitoring of the mitigation areas will occur annually until one of the two following criteria is met. Stipulation one, the population has exceeded a 3:1 ratio based on the highest total impact numbers to this species (44,098) i.e. a total repopulation estimate of the converted areas exceeds 132,294. Or stipulation two, the area has been monitored for five years without sufficient recruitment to meet stipulation one. This situation triggers a request for the 2024 collected seed to be grown by Native Plant Trust and replacement plugs of this species are planted into the 8 conversion areas.

Table 7. Field Paspalum Natural Revegetation Locations in TTT Areas

Tweed Airfield Section*	Acres	Impact Population Estimate (low)	Impact Population Estimate (high)	Estimated Seed Bank**
20	1.88	54	108	4,752 – 9,504
1	2.11	93	203	8,184 – 17,864
2	3.92	263	629	23,144 – 55,352
3	0.13	7	21	616 – 1,848
18	6.09	10,550	21,075	928,400 – 1,854,600
9 & 15	6.38	10,107	20,184	889,416 – 1,776,192
8	7.82	177	276	15,576 – 24,288
7	2.66	100	180	8,880 – 15,840
Totals	30.99	21,351	42,676	1.89 mil – 3.75 mil

**Refer to Appendix A for location specifics.*

*** Estimated based on average seed per maternal line of 8*

5.3 Presumed Presence Plant Protection Plan

Due to alterations in the original ratio for the proposed tide gate alteration area, 3.8 acres of additional tide marsh creation area remains to be surveyed. For the purposes of impact mitigation and this report, the presence of all the target species is presumed in the survey areas until the 2025 confirmation survey proves otherwise. The presented mitigation strategies will be implemented upon the infield observation of the species.

Rare plant surveys for the specific locations are scheduled for the spring of 2025. Surveys for these remaining areas will be conducted in a similar manner to the other tide marsh creation areas. Meander based surveys for seven target plant species will be conducted to evaluate the three project impacts areas (**Appendix A**). Habitat and vegetation data will be collected to assess the likelihood of rare species presence. Plants observed in the survey locations will be identified to the species level when possible. Any observed plant species that is identifiable only to the genus level and the target species can't be ruled out, will have an additional confirmation survey scheduled and conducted during the appropriate flowering window.

For reference, in **Table 8** below are the positive identification and seed collection windows for each target species.

Table 8. Presumed Presence Mitigation Identification Periods

Presumed Presence Target Species		Identification Periods		
		Vegetative	Flowering	Seed Collection
PrPr 1 - 3	yellow thistle (*Cirsium horridulum)*	April 1 – May 1	June 1 – July 15	June 30 – July 15
	two flowered cynthia (*Krigia biflora*)	April 15 – May 15	June 1 – June 30	June 15 – July 15
	saltpond grass (*Leptochloa fusca ssp. fascicularis*	June 15 – 30	July 1 – Aug 1	Oct 1 – Nov 1
	field paspalum (*Paspalum laeve*)	Aug 15 – Sept 1	Sept 1 – Nov 1	Sept 10 – Oct 11
	swamp lousewort (*Pedicularis lanceolata*)	April 15 – July 15	Aug 1 – Oct 1	Oct 15 – Nov 1
	New England blazing star (*Liatris novae-angliae*)	May 1 – Sept 15	Aug 1 – Sept 30	Oct 1 – Nov 1
	hoary plantain (*Plantago virginica*)	May 1 – June 1	June 1 – July 15	Sept 1 – Nov 1

Seed Collection, Storage, and Propagation

Mitigation strategies for the seven target species will <u>all</u> involve seed collection. Seed collection will serve as a backup strategy to any of the other proposed mitigation approaches reflected in each respective rare species mitigation section. Seed collection will be conducted at the appropriate time for mature seed, dependent on species and coordinated with the Tweed New Haven Airport Authority and The New HVN LLC Staff. Collected seeds will be sorted, counted and labeled according to Native Plant Trust NEPCoP Seed Collection Protocols and stored with NASAMI Farm for propagation.

Presumed Presence Mitigation Strategies by Species

Yellow thistle (E) – This perennial will be transplanted if observed within the additional survey areas. Transplanting this species will include a site assessment of the current location, associated species, elevation, soil type, moisture content and habitat characteristics to determine the best transplant location site on airport property. The ideal site will have similar biotic and abiotic factors and additionally be buffered from any present or future project impact area.

The selected transplant location may require habitat management or invasive plant management to improve site conditions for this species.

Transplanting will be conducted to maintain as much of the root ball around the plant as possible. Maintaining this soil will reduce plant stress and capture a portion of any existing seedbank.

Two flowered cynthia (T) – As a perennial species, transplanting any observed individuals to a similar location based on collected in situ habitat characteristics to include associated species, elevation, soil type, moisture content and habitat characteristics will be used to locate a suitable transplanting location that is buffered from any present or future project impacts.

The ideal site may require habitat management or invasive plant management to create suitable conditions for this

species.

Saltpond grass (E) – If this species is observed in any of the 2025 survey locations, individuals will be transplanted 200 feet north of Pig Farm Road to an area where a subpopulation is already known to occur. This area has existing available habitat and is protected from airport project impacts. Before transplanting, invasive species management will be conducted in this area to reduce coverage of (*Artemesia* sp.), Japanese knotweed (*Reynoutria japonica*) and aggressively growing native horseweed (*Erigeron canadensis*).

Transplanting will be conducted to maintain as much of the root ball around the plant as possible. Maintaining this soil will reduce plant stress and capture a portion of any existing seedbank.

Field paspalum (T) – Observed individuals of this species will be transplanted to non-impacted locations 200 feet north of Pig Farm Road where a subpopulation of this species is already known to occur. Prior to transplantation, invasive species management will be conducted in this area to reduce coverage of mugwort (*Artemesia* sp.), Japanese knotweed (*Reynoutria japonica*) and aggressively growing native horseweed (*Erigeron canadensis*).

Transplanting will be conducted to maintain as much of the root ball around the plant as possible. Maintaining this soil will reduce plant stress and capture a portion of any existing seedbank.

Swamp lousewort (T) – If this species is observed a meter-by-meter plot will be created around any individual or population. Both vegetative and abiotic factors within the plot will be recorded and used to determine a suitable transplanting location elsewhere on the Tweed New Haven Airport Authority and The New HVN LLC Property. A suitable new location for transplants will have a similar host vegetation, especially to include similar species composition and densities of graminoids and composites.

Transplanting will be conducted to maintain as much of the root ball around the plant as possible. Maintaining this soil will reduce plant stress and capture a portion of any existing seedbank. Additionally, this will retain any potential host species for the transplants.

New England blazing star (SC) – If this species is observed, individuals will be transplanted to non-impacted locations. The area 200 feet north of Pig Farm Road where other rare plants occur has available suitable sandy exposed habitat. Prior to transplantation, habitat management of this area for invasive and non-native species as well as aggressively growing horseweed (*Erigeron canadensis*) and any successional woody stems will be implemented to increase available habitat and decrease competition for the transplants.

Transplanting will be conducted to maintain as much of the root ball around the plant as possible. Maintaining this soil will reduce plant stress and capture a portion of any existing seedbank. Additionally, this will retain any potential host species for the transplants.

Hoary plantain (SC) - If this species is observed, individuals will be transplanted to non-impacted locations. The area 200 feet north of Pig Farm Road where other rare plants occur has available suitable sandy exposed habitat. Prior to transplantation, habitat management of this area for invasive and non-native species as well as aggressively growing horseweed (Erigeron canadensis) and any successional woody stems will be implemented to increase available habitat and decrease competition for the transplants.

Transplanting will be conducted to maintain as much of the root ball around the plant as possible. Maintaining this soil will reduce plant stress and capture a portion of any existing seedbank. Additionally, this will retain any potential host species for the transplants.

Rare Plant Recruitment Ratio

To gauge success or failure of any mitigation area where plants were transplanted from the additional 3.8 acres of tide gate alteration area, a recruitment ratio commensurate with the conservation status of each species will be used as a guideline. The two special concern (SC) species, New England blazing star and hoary plantain, will have a recruitment ratio of 1:1.5. For the three threatened (T) species, two-flowered cynthia, field paspalum and swamp lousewort, will have a recruitment ratio of 2:1. Finally, for the two endangered species, yellow thistle and saltpond grass will have a recruitment ratio of 3:1. Calculation of these ratios will include transplanted individuals, naturally germinating and propagated specimens.

To reach the desired recruitment ratio more quickly, it is recommended that Native Plant Trust begin the propagation process for any species where seed is collected and is also transplanted in the fall of 2025. The initiation of

germination protocols in the fall of 2025 will allow for the reintroduction of propagated plants to the transplant location by the fall of 2026. The number of plugs needed to meet the corresponding ratio will be determined by the total number of transplanted individuals.

Long-Term Monitoring and Management

Monitoring of transplant areas will take place during the appropriate identification windows for each species. Individuals that are transplanted or propagated will have unique labels to indicate its origin – transplant, propagated or natural. Monitoring is recommended to occur in any transplant location for up to five years. If at any time during these five years the population fails to meet the required species recruitment ratio, additional plants will be requested to be grown by Native Plant Trust for further transplantation.

Adaptive management during these five years may be required to alter, expand, or manage the selected transplant site to enhance available habitat for the transplants if population numbers are declining.

MEET TOM

Tom is an observant botanist dedicated to learning as much as he can about New England's natural habitats, ecosystems, and most importantly, plants. Over the past 10 years, Tom has been privileged enough to spend most of his time in the varied habitats of New England observing the habitats and flora. This natural habitat immersion and dedicated observation time have helped hone his ability to find rare plants and see the small differences in cryptic and often overlooked species. Tom has been providing ecological restoration advice to national wildlife refuges, state biologists, NRCS, and private landowners in Massachusetts, New Hampshire, and Vermont for the past decade.

Prior to BSC, Tom was responsible for planning, managing, and executing 1,400 acres of habitat restoration work annually on behalf of a Vermont-based forestry company. As a Senior Botanist with BSC Group, Tom has been leading rare plant surveys, ecological restoration mitigation strategies, and permitting of ecological projects with clients like National Grid, Eversource, and Bradley International Airport. Additionally, Tom was a BSC team member working with the City of Stamford, CT to map and prepare invasive management strategies to assist the city in meeting ecological restoration goals.

TOM IS A BOTANIST WHO IS FOREVER INTRIGUED BY THE WORLD AROUND HIM, EXCITED BY NATURAL HABITATS, AND OBSERVANT OF ALL THE SPECIAL COMPONENTS OF THE BIODIVERSITY IN NEW ENGLAND.

PROJECT EXPERIENCE HIGHLIGHTS

Eversource, 400/500 Lines Rebuild Project (Zone 5 of the ECT Program), Ledyard and Preston, CT
Senior Botanist

Oversaw the Atlantic White Cedar mitigation portion of this project including fencing, planting, long-term monitoring, reporting, and vegetation management to ensure compliance with Water Quality Certification (WQC) guidelines.

National Grid, Eversource, and Rhode Island Energy Rare Plant Surveys and Mitigation Guidance for Various Utility Projects
Senior Botanist

Perform rare plant surveys for transmission line companies in Vermont, New Hampshire, Massachusetts, Connecticut, and Rhode Island. Plan, identify, map, and report on rare plants as well as invasive populations in priority habitats in these New England states for reporting to Natural Heritage Programs to support utility line projects.

Bradley International Airport (BDL) Taxi Way Expansion Project, Windsor, CT
Senior Botanist

Surveyed, assessed, and reported on the quality of sand barren habitat in project expansion areas. Data was collected, mapped and a habitat restoration plan was prepared to provide the best ecological restoration options for rare species including lepidopterans, plants, and provide ecological recommendations to BDL and Natural Diversity Data Base (NDDB).

New England Power Company A1/B2 ACR Project Vernon, VT
Senior Botanist

Surveyed, collected seed, and provided recommendations to Vermont Agency of Natural Resources on transplanting of impacted rare plant species within the ROW.

Green Mountain National Forest, Mary Beth Deller, Vermont
Invasive Plant Specialist/Botanist

Provide expert recommendations on prioritization of invasive species treatment areas as well as provide appropriately timed treatments and reports.

Parker River & Great Bay National Wildlife Refuge, Nancy Pau, Portsmouth, NH & Newburyport, MA
Invasive Plant Specialist/Botanist

Work with MA Fish and Wildlife to advise, prepare, and execute invasive plant management practices in the NWRs.

E5/F6 Transmission Line Rare Plant Surveys, National Gride, Various Locations in MA
Lead Botanist

Conducted surveys of rare plants within priority habitat on National Grid ROW.

New England Power Company 3315 PIT/Footer Repair Project Monroe/Littleton, NH
Senior Botanist

Provided rare plant survey work for transmission line projects. Observed and reported a new station for *Carex castanea* (S1).

Eversource 1773 PINCO Rare Plant Survey Wethersfield, CT
Senior Botanist

Provided rare plant survey expertise and mitigation strategies for Eversource. Observed and reported new populations of *Carex typhina* within floodplain habitat.

National Grid, Y151 Transmission Line Rare Plants Surveys, Pelham, NH
Senior Botanist

Botanist for survey of rare plants with Marleigh Sullivan within priority habitat along multiple sections of Y151 ROW in Pelham, NH.

EDUCATOR EXPERIENCE

University of New Hampshire Cooperative Extension
Senior Botanist/Educator

Continuing education instructor for extension office on timber stand improvement and integrated pest management strategies.

Antioch University
Senior Botanist/Educator

Instructor for master's degree program on invasive plants and management strategies.

Rhode Island Nursery and Landscape Association
Senior Botanist/Educator

Continuing education instructor for Introduction to Botany and invasive plant management

University of Rhode Island Cooperative Extension
Senior Botanist/Educator

Continuing education instructor for invasive plant identification and invasive plant management.

Reported New Populations of Rare Plants (S1/S2)

- *Doellingeria infirma* – Southington, CT 2024
- *Collinsonia canadensis* –Bennington and Rutland Counties 2022
- *Silene ovata* – Asheville, NC 2021
- *Cypripedium parviflorum var. pubescens* – Cornish, NH 2022
- *Lupinus perennis* – Hudson, NH 2023
- *Viola adunca* – Royalston, MA 2023
- *Carex castanea* – Grafton County, NH 2023
- *Pycnanthemum virginianum* – Charlestown, NH 2023
- *Silene stellata* –Stamford, CT 2023

- *Carex typhina* –Wethersfield, CT 2023
- *Gentianopsis crinita* –Lebanon, NH 2023
- *Hackelia virginiana* –Lebanon, NH 2023
- *Viola lanceolata* –Vernon, VT 2023
- *Polygala polygama* –Vernon, VT 2023
- *Pycnanthemum torrei* – Pelham, NH 2023

New Populations of Uncommon Plants (S3)

- *Celsastrus scandens* – Swanton, VT 2020
- *Spiranthes lucida* – Manchester, VT 2022
- *Dirca palustris* – Arlington, VT 2022
- *Triosteum perfoliatum* – Cullowhee, NC 2022
- *Mimulus alatus* – Stamford, CT 2023

AWARDS

- Native Plant Trust - 2014 Marylee Everett Conservation Fellowship
- The Wildlife Society - 2013 Scholarship Awardee for 2-week long Wildlife Techniques course with Castleton State College and VT Fish & Wildlife
- New England Botanical Society - 2022 Les Mehrhoff Botanical Research Award

TABLE 1. RARE PLANTS

Task/Location	Date(s)	Clients	Description	Target Species (bolded species = those observed during survey)
W149 Transmission Line Rare Plant Surveys Walpole, Charlestown, Claremont, Lebanon, Cornish, Hanover, NH	June – September 2023	National Grid	Botanist for survey of rare plants with Marleigh Sullivan within priority habitat along length of W149 ROW in various New Hampshire towns.	▪ **Licorice goldenrod (*Solidago odora*)** ▪ **Climbing fumitory (*Adlumia fungosa*)** ▪ **Virginia mountain mint (*Pycnanthemum virginianum*)** ▪ **Virginia stickseed (*Hackelia* virginiana)** ▪ **Virginia waterleaf (*Hydrophyllum* virginianum)** ▪ **Fringed gentian (*Gentianopsis crinita*)** ▪ **White bear sedge (*Carex albursina*)**
Y151 Transmission Line Rare Plant Surveys Pelham, NH	June – September 2023	National Grid	Botanist for survey of rare plants with Marleigh Sullivan within priority habitat along multiple sections of Y151 ROW in Pelham, NH.	▪ **Bird's foot violet (*Viola pedata*)** ▪ **Licorice goldenrod (*Solidago odora*)** ▪ **Torrey's mountain mint (*Pycnanthemum torrei*)** ▪ **Clasping milkweed (*Asclepias amplexicaulis*)** ▪ **Red three awn (*Aristida longespica* var. geniculata)** ▪ **Common star-grass (*Hypoxis hirsuta*)** ▪ **Late purple American aster (*Symphyotrichum patens*)** ▪ **Anemone meadowrue (*Thalictrum thalictroides*)** ▪ **Wild lupine (*Lupinus perennis*)** ▪ **Eight flowered six weeks grass (*Vulpia octoflora*)**
A1/B2 Rare Plant Survey, Seed Collection and Transplanting Vernon, VT	September 2023	New England Power	Botanist for survey of ROW for known population of *Bartonia virginica* for population assessment, inventory, and seed collection prior to construction phase of transmission line rebuild project. Also found additional S1/S2 species previously unknown to this location. Transplanting of S1 *Viola lanceolata* has been permitted to take place Fall 2024.	▪ **Virginia screwstem (*Bartonia virginica*)** ▪ **Lance-leaved violet (*Viola lanceolata*)** ▪ **Racemed milkwort (*Polygala polygama*)**
I135/J136 Transmission Line Ashburnham, MA	May 2023	National Grid	Botanist for survey with Matt Hickler of ROW for rare plants in priority habitat along sections of ROW.	▪ **American twinflower (*Linnaea borealis*)** ▪ **Sand violet (*Viola adunca*)** ▪ Bartram's Shadbush *(Amelanchier bartramiana*) ▪ Pod-grass (*Scheuchzeria palustris*)
D21 Transmission Line Fall River, MA	August 2023	National Grid	Botanist for survey with Matt Charpentier (Oxbow Associates) of ROW for rare plants in priority habitat along sections of ROW.	▪ **Stiff yellow flax (*Linum medium* var. *texanum*)** ▪ **Philadelphia panic grass (*Panicum philadelphicum var. philadelphicum*)** ▪ **Long-leaved redtop-panic grass (*Coleataenia longifolia*)** ▪ Weak rush (*Juncus debilis*)

E5/F6 Transmission Line Rare Plant Surveys Shelburne, Conway, Deerfield, Sunderland, Shutesbury, Ware, West Brookfield, and Buckland, MA	July 2023	National Grid	Lead Botanist for surveys of rare plants withing priority habitat on National Grid ROW.	▪ **American bittersweet (*Celastrus scandens*)** ▪ **American ginseng (*Panax quinquefolius*)** ▪ **Musk monkeyflower (*Erythranthe moschata*)** ▪ Nodding chickweed (*Cerastium nutans*) ▪ Fragile rock-brake (*Cryptogramma stelleri*) ▪ Giant St. John's wort (*Hypericum ascyron*) ▪ Mountain alder (*Alnus viridis*) ▪ Pale green orchid (*Platanthera flava* var. *herbiola*) ▪ Appalachian bristle-fern (*Crepidomanes intricatum*) ▪ Climbing fumitory (*Adlumia fungosa*)
3315 Transmission Line Rare Plant Survey Monroe/Littleton, NH	June – September 2023	National Grid	Lead Botanist for surveys of rare plants withing priority habitat on National Grid ROW.	▪ **Chestnut sedge (*Carex castanea*)** ▪ **Brook lobelia (*Lobelia kalmii*)** ▪ American spurred gentian (*Halenia deflexa*) ▪ Fen grass-of-parnassus (*Parnassia glauca*) ▪ Loesel's wide-lipped orchid (*Liparis loeselii*) ▪ Small dropseed (*Sporobolus neglectus*)
Rare Plant & Habitat Surveys Bradley International Airport Windsor Locks, CT	August 2023	Hoyle & Tanner	Lead Botanist for surveys of rare plants and characterization and assessment of sand barren habitat for rare insect species for runway and taxi way expansion areas.	▪ Low frostweed (*Crocanthemum propinquum*) ▪ Davis' sedge (*Carex davisii*) ▪ Sickle-leaved golden-aster (*Pityopsis falcata*) ▪ Host Plant Surveys ▪ **Blueberries (*Vaccinium spp.*)** ▪ **Cherries (*Prunus spp.*)** ▪ **Rose *(Rosaceae spp.*)**
1773 Line ACR/OPGW Rare Plant Survey Wethersfield, CT	August 2023	Eversource	Lead Botanist for surveys of rare plants within priority habitat on Eversource ROW.	▪ **Cattail sedge (*Carex typhina*)**
1820/1830/1620 TTRP Rare Plant Survey Southington, CT	August 2024	Eversource	Lead Botanist for surveys of rare plants within priority habitat on Eversource ROW.	▪ **Appalachian stiff aster (*Doellingeria infirma*)** ▪ **Purple milkweed (*Asclepias purpurascens*)**

TABLE 2. OTHER PLANT VEGETATION SURVEYS/MONITORING

Project/ Location	Dates/Frequency	Client	Task	Description
400/500 Transmission Line Atlantic White	April – October 2023	Eversource	Planting, Fencing Installation and Monitoring	Oversaw selections, planting, fencing, competing vegetation management and monitoring of 1 acre of restoration planting

Cedar Restoration Project Ledyard, CT				of Atlantic White Cedars for mitigation.
Invasive Plant Mapping and Management Plan Stamford, CT	July 2023	City of Stamford, CT	Invasive species mapping and management plan recommendations	Worked with a team of individuals from BSC to strategize, organize and execute invasive species mapping for all CT listed species in 30+ parks city wide.

MEET JONATHAN

Jonathan is a Senior Wetland Scientist with a wide range of experience in botanical science, collaborating with professional scientists, and a particular interest/focus in taxonomy. Jonathan has over seven years of professional experience in plant identification and habitat surveys. A few of his more notable experiences include working at the New York Botanical Gardens (NYBG) as a Research Assistant and conducting vegetation surveys for the Bureau of Land Management (BLM). Jonathan is classically trained in plant taxonomy/systematics and obtained his Assessment Inventory and Monitoring certificate back in 2017 from the BLM.

Specifically, Jonathan has three years of Mitigation experience spanning two hydro-geographic regions (The Alluvial Floodplain of the Connecticut River and the First Bottom Wetlands of the Mississippi Alluvial Valley). Jonathan participated in the wetland mitigation project of a 330-acre Wildlife Sanctuary located in Longmeadow, MA and additionally a 1,200-acre true hydrological restoration of the Avoca Island Mitigation Bank located in Morgan City, LA.

JONATHAN HAS THREE YEARS OF MITIGATION EXPERIENCE SPANNING TWO HYDRO-GEOGRAPHIC REGIONS (THE ALLUVIAL FLOODPLAIN OF THE CONNECTICUT RIVER AND THE FIRST BOTTOM WETLANDS OF THE MISSISSIPPI ALLUVIAL ALLEY).

PROJECT EXPERIENCE HIGHLIGHTS

400/500 Line Rebuild (Atlantic White Cedar Restoration)
Senior Wetland Scientist

Participated in the restoration of an Atlantic White Cedar (AWC) grove. The Atlantic White Cedar wetland groves are considered critical habitat in the state of CT. Therefore, mitigation plans to enhance and enlarge the existing stand were needed to offset the impacts. Gridling and subsequent planting (AWC saplings) are among the mitigation measures implemented. Direct responsibilities included habitat assessment/surveying, As-built mapping. supervising vegetation crews, proper implementation of permit conditions, and restoration monitoring.

V148S Line (ACR) Rare Plant Survey- Lincoln RI
Senior Wetland Scientist

Lead in a rare plant survey for targeted species including the daisy-leaved moonwort (Botrychium matricariifolium), orange fruited horse-gentian (Triosteum aurantiacum) and state listed slender-leaved agalinis (Agalinis tenuifolia).

CT – 32 Vegetation Management Project, Hurd State Park, East Haddam, CT
Senior Wetland Scientist

Assisted in a rare plant survey for targeted species registered on CT's endangered list. Previously known locations were surveyed to approximate existing populations to preserved during vegetation management on 3 acres of existing ROW. Areas identified were flagged in the field and mapped with ArcGIS. The two targeted species included mountain sandwort (Minuartia glabra) and hyssop/helmet skullcap (Scutellaria integrifolia). Also was on site to monitor as BSC Botanist and ensured all NDDB and State Licenses conditions were achieved during tree cutting.

21C1 Distribution line in Montague and Greenfield, MA
Senior Wetland Scientist

Assisted in a rare plant survey in a cross-country ROW designated as priority habitat. Using the NHESP's State-Listed Species Habitat Assessment and Survey Guidelines a slow meander-based field survey was conducted within proposed work limits. Population size, associated habitat, and evidence of past disturbances for each rare plant population were among the required observations. Targeted species included American Bittersweet (Celastrus scandens), Michaux's Sandwort (Minuartia michauxii), and Mountain Alder (Alnus viridis ssp.crispa) were observed.

1773 Line ACR in Wethersfield, CT
Senior Wetland Scientist

Assisted in a rare plant survey for targeted species registered on CT's endangered list. Previously known locations were surveyed to approximate existing populations to preserved during transmission line construction. Areas identified were flagged in the field and mapped with ArcGIS. The two targeted species included northern arrowhead (*Sagittaria cuneata) and cattail sedge (*Carex typhina).

Stanford Invasive Species Survey - Total of 32 Parks Surveyed
Senior Wetland Scientist

Assisted in surveying approximately 32 City Parks in Stanford, Connecticut. This involved conducting a slow, meandering survey in both managed and unmanaged areas. The physiographic regions covered a range from the coastline to inland areas, including habitats such as wetlands, stream banks, and upland forested areas. As part of my role, I also participated in data collection and organization.

WETLAND DELINEATIONS, CT

TRRP CT- 09 Wetland Delineation – Linear Project (Transmission line) ~40 miles, New Milford, Brookfield, Bethel, Danbury, Redding, Southbury, Newtown, CT October 2022
Senior Wetland Scientist

Principal delineator in an edge-to-edge delineation within the Right-of-Way, as defined by the specifications of hydric soils outlined in the CT Inland Wetlands & Water Course Act. Leading the delineations involves employing the ACOE wetland manual methodology to define the boundaries of wetlands entering the Right-Of-Way. Techniques encompass the identification of hydric and non-hydric soils using hand augers and shovels, along with recording dominant vegetation and hydrological indicators. Additionally, the delineation of surface waters, encompassing water bodies, rivers, and streams, entails the application of ACOE Ordinary High Water Mark methodologies.

TRRP CT-26 Wetland Delineation – Linear Project (Transmission line) ~38 miles, Bloomfield, Windsor, South Windsor, East Hartford, Manchester, Hartford January 2023
Senior Wetland Scientist

Principal delineator in an edge-to-edge delineation within the Right-of-Way, as defined by the specifications of hydric soils outlined in the CT Inland Wetlands & Water Course Act.
Leading the delineations involves employing the ACOE wetland manual methodology to define the boundaries of wetlands entering the Right-Of-Way. Techniques encompass the identification of hydric and non-hydric soils using hand augers and shovels, along with recording dominant vegetation and hydrological indicators. Additionally, the delineation of surface waters, encompassing water bodies, rivers, and streams, entails the application of ACOE Ordinary High Water Mark methodologies.

TRRP CT-20 Wetland Delineation – Linear Project (Transmission line) ~35 miles, Ridgefield, Redding, Weston, Wilton, Norwalk, Bridgeport, Trumbull, Stratford, Milford March 2023
Senior Wetland Scientist

Principal delineator in an edge-to-edge delineation within the Right-of-Way, as defined by the specifications of hydric soils outlined in the CT

Inland Wetlands & Water Course Act.
Leading the delineations involves employing the ACOE wetland manual methodology to define the boundaries of wetlands entering the Right-Of-Way. Techniques encompass the identification of hydric and non-hydric soils using hand augers and shovels, along with recording dominant vegetation and hydrological indicators. Additionally, the delineation of surface waters, encompassing water bodies, rivers, and streams, entails the application of ACOE Ordinary High Water Mark methodologies.

1773 Line ACR & OPGW Installation Project Wetland Delineation- Linear Project (Transmission line) ~ 12 miles, Berlin, Rocky Hill, Wethersfield, Hartford December 2023
Senior Wetland Scientist

Principal delineator in delineation within the Right-of-Way, as defined by the specifications of hydric soils outlined in the CT Inland Wetlands & Water Course Act.
Leading the delineations involves employing the ACOE wetland manual methodology to define the boundaries of wetlands entering the Right-Of-Way. Techniques encompass the identification of hydric and non-hydric soils using hand augers and shovels, along with recording dominant vegetation and hydrological indicators. Additionally, the delineation of surface waters, encompassing water bodies, rivers, and streams, entails the application of ACOE Ordinary High Water Mark methodologies.

WETLAND DELINEATIONS, RI

S171/T172 Lighting Mitigation Wetland Delineations- Linear Project (Transmission line) Unknown miles - Warwick, West Warwick, Cranston, Johnston, Smithfield, North Smithfield. November 2023
Senior Wetland Scientist

Principal delineator in an edge-to-edge delineation within the Right-Of-Way. RI refers to the ACOE wetland manual and delineation is conducted accordingly.
Leading the delineations involves employing the ACOE wetland manual methodology to define the boundaries of wetlands entering the Right-Of-Way. Techniques encompass the identification of hydric and non-hydric soils using hand augers and shovels, along with recording dominant vegetation and hydrological indicators. Additionally, the delineation of surface waters, encompassing water bodies, rivers, and streams, entails the application of ACOE Ordinary High Water Mark methodologies.

WETLAND DELINEATIONS, MA

E5/F6 ACR Project Wetland Delineation – Linear Project (Transmission line) Unknown miles - Shelburne, Buckland, Conway, Deerfield, Sunderland, Leverett, Shutesbury, Pelham, Belchertown, Ware, West Brookfield, North Brookfield, East Brookfield, Spencer, Leicester, Auburn, Millbury, January 2024
Senior Wetland Scientist

Principal delineator in an edge-to-edge delineation within the Right-Of-Way. MA defers to their Massachusetts Handbook for delineation of Bordering Vegetated Wetlands.
Leading the delineations involves employing the MA manual for BVW methodology to define the boundaries of wetlands entering the Right-Of-Way. Techniques encompass the identification of hydric and non-hydric soils using hand augers and shovels, along with recording dominant vegetation and hydrological indicators. Additionally, the delineation of surface waters, encompassing water bodies, rivers, and streams, entails the application of the Mean Annual High Water Mark methodologies specific to MA.

PROJECT MANAGEMENT

3557 Line Asset Condition Replacement Project- Eversource (Linear Project) South Windsor, CT
Project Manager/Environmental Construction Monitor

Responsibilities included the preparation of permitting assessment and risk assessment forms for individual projects. I took the lead in wetland delineations and was accountable for obtaining permits for the installation and replacement of the new structure. In addition, I conducted weekly construction compliance inspections to ensure that the work adhered to the requirements of the Orders of Conditions. Tracking work progress during both construction and restoration phases of multiple projects, I also coordinated progress updates and scheduling with clients and subcontractors.

MT Washington Telephone Pole Replacement, Eversource (Linear Project) Washington, MA April 2023
Project Manager/Environmental Construction Monitor

Responsibilities included the preparation of permitting assessment and risk assessment forms for individual projects. I took the lead in wetland delineations and was accountable for obtaining permits for the installation and replacement of the new structure. In addition, I conducted weekly

construction compliance inspections to ensure that the work adhered to the requirements of the Orders of Conditions. Tracking work progress during both construction and restoration phases of multiple projects, I also coordinated progress updates and scheduling with clients and subcontractors.

1635 Line Assess Condition Replacement Project, Eversource (Linear Project), South Windsor, CT August 2023

Project Manager/Environmental Construction Monitor

As a Project Manager and Environmental Construction Monitor, my responsibilities included the preparation of permitting assessment and risk assessment forms for individual projects. I took the lead in the wetland. In addition, I conducted weekly construction compliance inspections to ensure that the work adhered to the requirements of Eversource BMP. Tracking work progress during both construction and restoration phases of multiple projects, I also coordinated progress updates and scheduling with clients and subcontractors.

PRIOR TO BSC, JONATHAN'S PROJECT EXPERIENCE INCLUDES:

Avoca Island, Avoca Island Heritage Bank, Morgan City, LA 2021

Wetland Plant Ecologist

Phase 1 of Avoca Island Mitigation Bank is a 500-acre wetland restoration in the Lower Atchafalaya Basin. Avoca Island plays a vital role in surge protection and storm abatement by buffering powerful storms entering from the Gulf of Mexico. Responsibilities included preliminary assessments, monitoring, construction of the bank, drafting As-Built reports and assisting in writing the Mitigation Banking Instrument (MBI) for Phase 2.

LSU Mitigation Bank, ESP and SLR, St. Gabriel, LA 2020

Wetland Plant Ecologist

LSU Mitigation Bank is a 1,000-acre wetland mitigation project in the Lake Ponchartrain Basin involving a unique collaboration between investors and the University with the intentions to create educational and research opportunities. Responsibilities included implementing and conducting hydrological monitoring, wetland delineations, habitat assessments, and drafting the Prospectus.

Blouin Mitigation Bank, Raceland, LA 2020

Wetland Plant Ecologist

Phase 1 and 2 of the Blouin Mitigation Bank is a 500-acre converted farmland within the Terrebonne Basin. Its unique location in the watershed allows large volumes of agricultural runoff to be retained and filtered before entering local ground water supplies. Phase 1 and 2 construction was completed in the winter of 2021. Responsibilities included vegetation surveys, planting crew operations, drafting As-Built reports and surveying drainage features.

Lowland Mitigation Bank, Lafourche, LA 2020

Wetland Plant Ecologist

Lowland is in the initial stages of becoming a MB. It is over 500-acres of prior converted farmland within the Barataria basin. Preliminary data collection includes hydrological monitoring, habitat assessments and feasibilities, wetland delineations, and drafting Prospectus.

Bayou Thornton Mitigation Bank, St. Francisville, LA 2020

Wetland Plant Ecologist

Bayou Thornton is a 230-acre wet farmland situated between the natural levees of the Mississippi and Atchafalaya Rivers. This MB included re-establishment and enhancement areas of degraded habitat. My involvement came 2 years after post construction and focused on obtaining the success criteria needed for additional credit releases. Responsibilities included completing the First Year Success Monitoring Report and subsequential adaptive management required by ACOE to achieve successful rates. Some tasks included drafting Adaptive Management Report, planting crew operations, florist mapping, and follow up monitoring and reports.

Fannie Stebbins, The Nature Conservancy, Longmeadow, MA 2019

Wetland Plant Ecologist

This project comprised of a 330-acre degraded floodplain adjacent to the Connecticut River. This restoration project included 7 abandoned agricultural fields and their surrounding flood plain forest. Responsibilities included supervising field crews during restoration activities, nursery coordination, creation of conceptual plans, florist mapping and drafting the As-Built Report.

Juniper Point Rd, Branford, CT 2019

Wetland Plant Ecologist

Saltwater marsh restoration involving 5 acres of highly degraded habitat surrounded by developments. This wetland's values and functions were important to the surrounding developments which included runoff detention, filtration, and

storm surge abatement. Responsibilities included invasive plant management, monitoring, and mapping plant communities. Additionally, restoration efforts included operating Low Ground Pressure vehicles, mowing equipment, and delivering chemical controls to fully restore the area to natural condition.

MEET OLIVIA

Olivia is an Ecologist in the Ecological Services Department of BSC's Glastonbury office. She assists with various natural resource assessments such as wetland delineations, vernal pool surveys, invasive and rare plant surveys, and acoustic bat surveys. In addition, she performs construction monitoring and assists with project reporting and permitting.

OLIVIA ASSISTS WITH VARIOUS NATURAL RESOURCE ASSESSMENTS SUCH AS WETLAND DELINEATIONS, VERNAL POOL SURVEYS, INVASIVE AND RARE PLANT SURVEYS, AND ACOUSTIC BAT SURVEYS.

PROJECT EXPERIENCE HIGHLIGHTS

National Grid, E5F6 Transmission Line Wetland Delineation, Western-Central MA
Field Assistant/GPS
Responsible for accurate mapping of wetland delineation boundaries on Trimble GPS unit throughout entire Right-of-Way corridor in accordance with Massachusetts WPA standards.

Eversource, 1773 Line Wetland Delineation, Berlin, Rocky Hill, Wethersfield CT
Field Assistant/GPS
Responsible for accurate mapping of wetland delineation boundaries on Trimble GPS unit for 12-mile Right-of-Way corridor in accordance with USACE standards.

City of Stamford, Invasive Species Survey, Stamford CT
Field Staff
Assisted with 10-day effort to identify and map invasive plant species populations across 38 city parks totaling 448 acres.

National Grid, E131 Transmission Line Acoustic Bat Survey, Western MA, and Southern VT
Field Staff
Carried out installation, maintenance, and retrieval of acoustic bat monitors along approximately 10 miles of the E131 Transmission Line.

Eversource, CT-26 Vernal Pool Evaluation, Bloomfield, South Windsor, Manchester CT
Field Assistant/GPS

Responsible for accurate mapping of vernal pool boundaries on Arrow GPS unit and assessment of biological and hydrological features including identification of vernal pool indicator species.

National Grid, E205E/W Line Rare Plant Survey, Rowe, and Greenfield MA
Field Assistant/GPS

Assisted with accurate identification and mapping of rare plant populations on Arrow GPS unit. Work was performed at two structures and their associated access along a 200 ft wide transmission line corridor.

Eversource, East Road Reconductor Project, Richmond MA
Environmental Compliance Monitor

Responsible for weekly construction compliance inspections over a three-month period to ensure pole replacement and reconductoring work was performed in accordance with Eversource Best Management Practices and the Order of Conditions issued by the Conservation Commission.

PRIOR TO JOINING BSC, OLIVIA CONTRIBUTED TO THE FOLLOWING PROJECTS:

GLORIA Yellowstone Survey, Betty Ford Alpine Gardens and Colorado Natural Heritage Program, WY
Conservation Intern

Assisted with a week-long backcountry sampling effort for Yellowstone's Global Observation Research Initiative in Alpine Environments (GLORIA) site. Followed detailed survey protocol to identify plant species richness, cover, and dominance along an elevational gradient.

VHB, South Burlington, VT
Environmental Science Intern

Assisted with wetland delineations, invasive species population monitoring, and wildlife habitat surveys throughout Vermont for a variety of clients in the energy and transportation sectors.

C. Plant Species Inventory

Non-Native Species

Scientific Name	Common Name
Aira praecox	early hair grass
Amorpha fruticosa	false indigo bush
Anthoxanthum odoratum	sweet vernal grass
Bromus commutatus	meadow brome
Centaurea jacea	brown knapweed
Centaurea stoebe	spotted knapweed
Cirsium arvense	creeping thistle
Cirsium vulgare	common thistle
Convolvulus arvensis	field bindweed
Digitaria ischaemum	smooth crabgrass
Cyperus brevifolius	shortleaf spikesedge
Festuca myuros	rattail sixweeks grass
Froelichia gracilis	slender snakecotton
Holcus lanatus	velvet grass
Hypericum perforatum	common St. John's wort
Hypochaeris radicata	common cat's ear
Kummerowia striata	Japanese clover
Leontodon saxatilis	hairy hawkbit
Leucanthemum vulgare	oxeye daisy
Lolium prenne	perennial ryegrass
Lotus tenuis	narrow-leaf bird's-foot trefoil
Melilotus officinalis	yellow sweet clover
Myosostis stricta	blue forget-me-not
Phragmites australis	common reed
Pilosella caespitosa	meadow hawkweed
Pilosella officinarum	mouse-eared hawkweed
Pilosella piloselloides	smooth hawkweed
Plantago arenaria	branched plantain
Plantago lanceolata	ribwort plantain
Potentilla argentea	silvery cinquefoil
Potentilla recta	sulphur cinquefoil
Puccinellia distans	European alkali grass
Pyrus calleryana	Callery pear
Ranunculus acris	meadow buttercup
Rubus laciniatus	cutleaf blackberry
Schoenoplectiella mucronate	bog bulrush
Scleranthus annuus	annual knawel
Scorzoneroides autumnalis	autumn hawkbit
Securigera varia	purple crownvetch
Sedum sarmentosum	stringy stonecrop
Senecio vulgaris	common groundsel
Spergularia rubra	red sand spurrey
Stellaria graminea	lesser stichwort
Trifolium campestre	hop trefoil
Vicia tetrasperma	smooth tare
Vincetoxicum rossicum	European swallow-wort

Native Species

Scientific Name	Common name
Acalypha rhomboidea	common copperleaf
Ambrosia trifida	giant ragweed
Andropogon virginicus	broomsedge bluestem
Aristida oligantha	oldfield three-awn
Atriplex prostrata	fat-hen
Baccharis halimifolia	eastern false willow
Betula populifolia	gray birch
Bidens cernua	nodding beggarticks
Carex annectens	yellow-fruited sedge
Carex blanda	eastern woodland sedge
Carex comosa	bristly sedge
Carex debilis	white-edge sedge
Carex granularis	limestone meadow sedge
Carex intumescens	bladder sedge
Carex longii	green and white sedge
Carex pellita	woolly sedge
Carex scoparia	pointed broom sedge
Carex stricta	tussock sedge
Carex swanii	Swan's sedge
Chamaecrista nictitans	sensitive pea
Chamaecrista fasciculata	partridge pea
Clethera alnifolia	sweet pepperbush
Cyperus erythrorhizos	redroot flatsedge
Cyperus esculentus	yellow nutsedge
Cyperus strigosus	straw-colored flatsedge
Desmodium species	tick-trefoil
Dichanthelium clandestinum	deertongue
Dichanthelium dichotomiflorum	smooth witchgrass
Dichanthelium microcarpon	small fruited witchgrass
Distichlis spicata	saltgrass
Echinochloa muricata	rough barnyard grass
Eleocharis obtusa	blunt spikerush
Erigeron annuus	annual fleabane
Elymus virginicus	Virginia wild-rye
Eupatorium pilosum	rough boneset
Euthamia graminifolia	flat-topped goldenrod
Galium palustre	common marsh-bedstraw
Helianthus giganteus	giant sunflower
Hibiscus moscheutos	swamp rose mallow
Hypericum gentianoides	pineweed
Hypericum prolificum	shrubby St. John's wort
Ilex verticillata	winterberry holly
Juncus acuminatus	tapered rush
Juncus gerardi	saltmeadow rush
Juncus tenuis	slender path rush
Juniperus virginiana	eastern redcedar
Leersia oryzoides	rice cutgrass
Lepidium virginicum	Virginia pepperweed
Lespedeza capitata	round-headed bush-clover
Limonium carolinianum	Carolina sea-lavender
Lindernia dubia var. *anagallidea*	slender false pimpernel
Ludwigia alternifolia	seedbox
Mikania scandens	climbing hempvine
Morella pensylvanica	Northern bayberry

Scientific Name	Common name
Muhlenbergia schreberi	nimblewill
Nuttallanthus canadensis	blue toadflax
Panicum virgatum	switchgrass
Paspalum laeve var. *circulare*	field paspalum
*Paspalum pubiflorum**	four-rowed bead grass
Paspalum setaceum var. *muhlenbergii*	slender bead grass
Penstemon digitalis	foxglove beardtongue
Persicaria species	smartweed
Pilea fontana	springs clearweed
Plantago aristata	bracted plantain
Plantago lanceolata	ribwort plantain
Ranunculus sceleratus	cursed crowfoot
Rhus copallinum	shining sumac
Rosa virginiana	Virginian rose
Rubus flagellaris	common dewberry
Sagittaria species	arrowhead species
Salicornia depressa	Virginia glasswort
Schizachyrium scoparium	little bluestem
Schoenoplectus tabernaemontani	soft-stemmed bulrush
Scirpus pendulus	nodding bulrush
Silene antirrhina	sleepy catchfly
Sisyrinchium angustifolium	narrow-leaved blue-eyed grass
Smilax glauca	sawbrier
Solidago nemoralis	field goldenrod
Solidago sempervirens	Northern seaside goldenrod
Sorghastrum nutans	indian grass
Spergularia marina	saltmarsh sand spurry
Sporobolus alterniflorus	saltmarsh cordgrass
Sporobolus michauxianus	prairie cordgrass
Sporobolus pumilus	marsh hay cordgrass
Sporobolus vaginiflorus	poverty dropseed
Strophostyles helvola	trailing fuzzy-bean
Suaeda calceoliformis	horned seablite
Symphyotrichum patens	late purple aster
Symphyotrichum pilosum	hairy white oldfield aster
Symphyotrichum racemosum	small white aster
Symphyotrichum subulatum	annual saltmarsh aster
Symphyotrichum tenuifolium	perennial saltmarsh aster
Toxicodendron radicans	easter poison ivy
Tradescantia ohiensis	Ohio spiderwort
Utricularia gibba	humped bladderwort
Verbena hastata	blue vervain
Viburnum dentatum	smooth arrowwood
Viola lanceolata	white bog violet

D. Survey Photos

BSC GROUP

Photo 1: Typical airfield vegetative community and habitat during the June 2024 survey window.

Photo 2: Tweed Airport fulfilled BSC's request to stop mowing three weeks in advance of each survey time period. During the June surveys the height of the vegetation was upwards of 24" tall.

Photo 3: Two of the four congener species observed for target species *Krigia biflora* (two-flowered cynthia). On the left *Pilosella caespitosa* (meadow hawkweed) and on the right *Pilosella officinarum* (mouse-eared hawkweed).

Photo 4: Other congener species for two-flowered cynthia included on the right *Hypochaeris radicata* (common cat's-ear) and on the left, *Pilosella piloselloides* (smooth hawkweed).

BSC GROUP

Photo 5: Congener species for hoary plantain, ribwort plantain (*Plantago lanceolata)*, has wide smooth leaves. This non-native species was dominant throughout the survey areas.

Photo 6: An additional congener species for hoary plantain observed during the Tweed Airport surveys, bracted plantain (*Plantago aristata*) was ruled out as the target species by the narrow, lanceolate leaves.

BSC GROUP

Photo 7: The southern Runway Extension Area (Tweed Airport Section 6) during the June 2024 survey. This area is dominated by non-native species, primarily species of clover *(Trifolium*).

Photo 8: A congener for target species *Cirsium horridulum* (yellow thistle), *Cirsium arvense* (creeping thistle) primarily observed along the southern portions of the southern Runway Extension area (Tweed Airport Section 6).

Photo 9: The area of highest plant diversity was observed within the Terminal Expansion Area (Tweed Airport Sections 11 – 14). This photo (Tweed Airport Section 13) depicts a high-density area of both the typical blue *Sisyrinchium angustifolium* (narrow-leaved blue-eyed grass) as well as a population of the white form. Additional species observed were *Juncus tenuis* (slender path rush), *Carex longii* (green and white sedge), and *Viola lanceolata* (white bog violet). Species only observed in Tweed Airport Section 11 were *Carex granularis* (limestone meadow sedge) and *Scirpus pendulus* (nodding bulrush).

Photo 10: Field paspalum (*Paspalum laeve* var. *circulare*) observed over much of the Tweed Airport property during the September 2024 survey.

BSC GROUP

Photo 11: Congener species for field paspalum, slender bead grass (*Paspalum setaceum* var. *mulhenbergii*) was infrequent when observed, but was observed intermixed with target species populations.

Photo 12: The Terminal Expansion Area (Tweed Airport Section 11). Areas to the southwest of the pavement where 500 – 600 individual plants of field paspalum occurs and where Turf to Pavement (TTP) land conversion is proposed.

BSC GROUP

Photo 13: This single occurrence of *Paspalum pubiflorum* var. *glabrum* was observed in a Turf to Turf (TTT) conversion section of Tweed Airport Section 18. This is a species not recognized in the New England flora, but herbarium records indicate another observation of this species in 1967 at the Pine Hills Field Station in Simsbury, CT.

Photo 14: Tweed Airport Section 18 - shown here is an example of a Turf to Turf (TTT) land conversion area. In this unit, a clear line between previously seeded areas and areas that revegetated naturally were observed in multiple locations in addition to this section. Areas where a re-seeding protocol was not followed or the seeding attempt failed, had very high-density populations of field paspalum. In this photo, brown area to the left is high-density field paspalum and green area to the right was successfully hydroseeded with other species of plant seed.

Photo 15: Similar to Photo 13, this is the northeast edge of Tweed Airport Section 15. A similar example of seeding with non-native plant seeds and an area where the existing seed bank germinated into high density field paspalum.

Photo 16: *Leptochloa fusca* var. *fasciculata* pictured here, was observed in two locations within the Tweed Airport property.

Photo 17: The first population of saltpond grass was observed at the end of an old "dump" road adjacent to the airfield. In the background of this photo and a threat to the population is Japanese knotweed (*Reytournia japonica*) and mugwort *(Artemesia spp.).* White pin flags indicate individual plants.

Photo 18: Another photo of the dump road showing bare, sandy ground with encroaching invasive species in the background.

BSC GROUP

Photo 19: Tide Gate Alteration Area PP1 – common reed is in high density in this area.

Photo 20: Tide Gate Alteration Area PP2 – common reed is in high density in this area.

Photo 21: Tide Gate Alteration Area PP3 – common reed is in high density in this area with the occasional upland that has a more native vegetative mix.

Photo 22: Tide Gate Alteration Area PP4 – occasionally observed was a pocket with lower density common reed and more native species represented.

Photo 23: Tide Gate Alteration Area PP5 – where common reed wasn't the dominant vegetation, saltmarsh cordgrass was observed to be the dominant vegetation. These were often areas already experiencing more frequent inundation from tidal fluctuations.

Photo 24: Tide Gate Alteration Area PP6 – common reed is in high density in this area, but similar to Photo 24, saltmarsh cordgrass was occasionally found in high-density pockets where water levels were intermittently higher.

Photo 25: Tide Gate Alteration Area PP7 – one of the smaller survey areas, this section was primarily dominated by common reed but also autumn olive and multiflora rose.

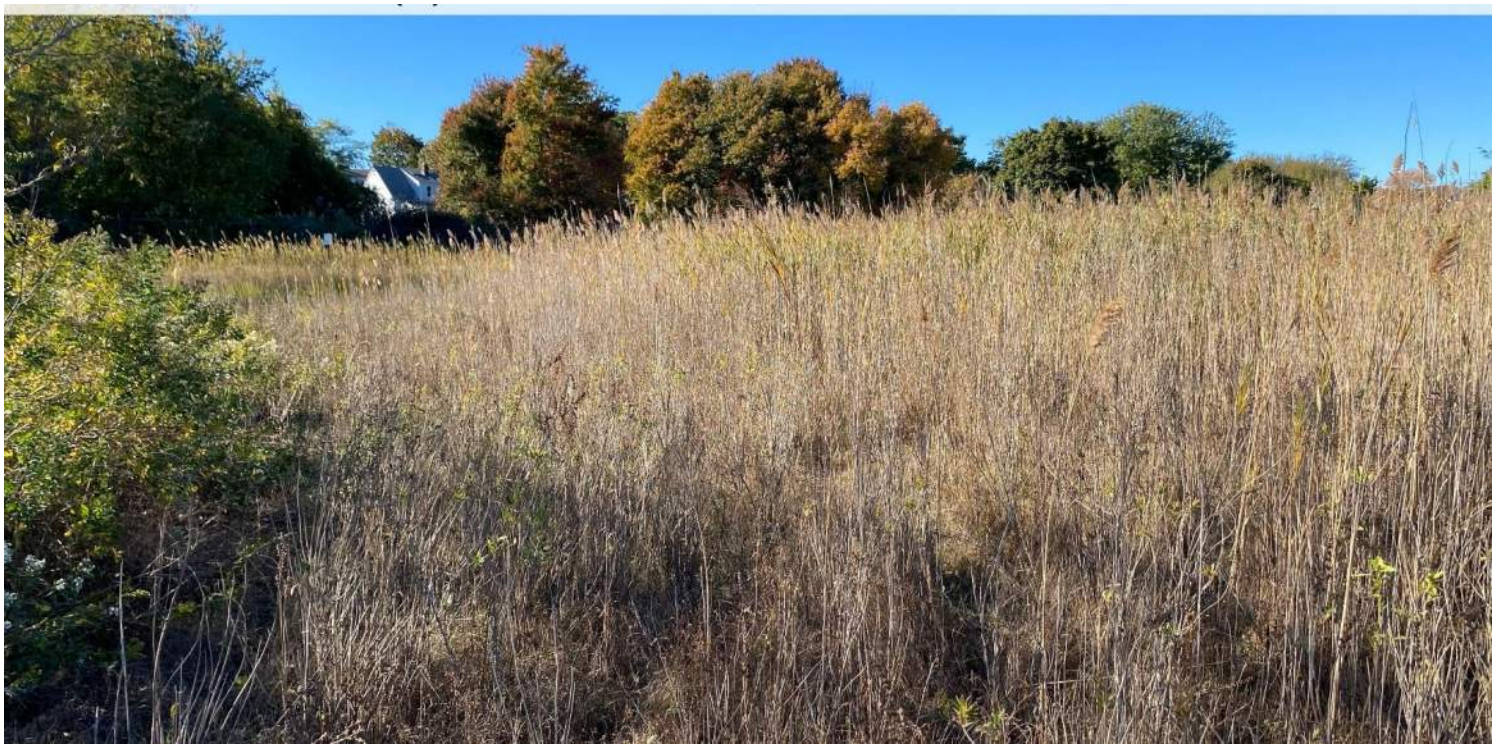

Photo 26: Tide Gate Alteration Area PP8 – plant species in this area were indicative of tide marsh vegetation. Native species present in this location were saltgrass (*Distichlis spicata*), perennial and annual saltmarsh asters (*Symphotrichum tenuifolium* and *S. subulatum*), horned seablight *(Suaeda calceoliformis*) and Virginia glasswort (*Salicornia depressa*)

Photo 27: Tide Gate Alteration Area PP9 – this location was the closest survey area to the actual tide gate. In this location vegetation was either dominated by common reed or saltmarsh cordgrass.

Photo 28: Tide Gate Alteration Area PP10 – this area was primarily on the western side of Morris Creek. Only small portions of this area were not dominated by common reed. This photo shows an area dominated by common reed with a patch of saltmarsh cordgrass in the center.

Photo 29: Tide Gate Alteration Area PP11 – common reed dominated this survey location with little to no other plant species present even along open edges of the survey location.

Photo 30: Tide Gate Alteration Area PP12 – the majority of the marsh was dominated by common reed with an occasional upland island that was dominated by native species such as white oak (*Quercus alba)* and sweet pepperbush (*Clethera alnifolia*).

BSC GROUP

Photo 31: Tide Gate Alteration Area PP13 – this area southwest of Pig Farm Rd. was also dominated by common reed with the occasional open area dominated by saltmarsh cordgrass.

Photo 32: Tide Gate Alteration Area PP14 – wetlands in this area were dominated by common reed but the adjacent upland habitat had stands of black gum (*Nyssa sylvatica*) as seen here.

Photo 33: Tide Gate Alteration Area PP15 – typical through much of the Tide Gate Alteration survey areas was common reed 12 – 15 feet tall and extremely dense.

Photo 34: Tide Gate Alteration Area PP16 – the southern edge of this area along Uriah St., was dominated by invasive species such as multiflora rose and common reed. Occasionally, observed were patches of saltmarsh cordgrass but few other native species.

Photo 35: Tide Gate Alteration Area PP17 – An observation of a non-native species with few other historic New England observations. Bog bulrush (*Schoenoplectiella mucronata*) is a plant species native to Eurasia, Africa and Australia with the closest recent observations on Long Island, NY.

F. NDDB Responses

May 17, 2024

Deb Coon
Hoyle, Tanner and Associates
150 Dow Street
Manchester, NH 03101

NDDB Request Additional Information
Project: Tweed New Haven Airport Runway Extension and Terminal Expansion
Filing ID 107828

Dear Ms. Coon,

As described in the NDDB review application, this project will involve the rehabilitation and extension of Runway 2-20, and the construction of a new east side passenger terminal and associated runways, parking lots, aprons and taxiways.

The following species have been documented within the vicinity of the work to be conducted:

Plants

- Yellow thistle (*Cirsium horridulum*) – State Endangered
  - Habitat: Coastal grasslands; airports; open-canopy trailsides and roadsides; inner salt marsh borders; *Juniperus-Panicum virgatum* communities, scrub communities, and forest edges bordering salt marshes.
  - Blooms June – July.
- Saltpond grass (*Leptochloa fusca ssp. fascicularis*) – State Endangered
  - Habitat: Coastal, in brackish ponds and shores of "salt ponds", borders of salt and brackish marshes, sandy depressions in coastal grasslands and sandy roadsides that are flooded by the highest mesohaline or polyhaline spring tides of the year. Populations found inland growing along highways are not believed to be of native Connecticut provenance.
  - Blooms and fruits August – November.
- Field paspalum (*Paspalum laeve*) – State Threatened
  - Habitat: Mostly near the coast, extending inland in the Connecticut River towns only as far as Cromwell and Glastonbury, and disjunct as a historic in Franklin. Hydric to moderately well drained fields, meadows, grasslands, floodplain grasslands and meadows, thickets, and shores, seasonally flooded and exposed open-canopy vernal pools. Utility ROWs, airports near the coast. Tolerant of mowing, at least at some sites. Critical Habitats include: Alluvial Grassland/Outcrop; Grassland Subtype: Coastal Grassland.
  - Fruits August – October.
- Two-flowered Cynthia (*Krigia biflora*) – State Threatened
  - Habitat: Dry to wet meadows, fields, rocky woods, and roadsides.

    - Blooms Jun.
- Hoary plantain (*Plantago virginica*) – State Special Concern
    - Habitat: Dry acidic or basic, rocky, sandy, or gravelly soil. Pastures, grasslands, floodplain levee and stream bank forests, roadsides, low traprock outcrops in old fields, calcareous (high-pH) open woodlands, dry fields, gravel banks, traprock ridges. Critical Habitats: Subacidic Rocky Summit/Outcrop; Subacidc Rocky/Summit Outcrops (probably); Floodplain Forest, High Floodplain Subtype; Dry Circumneutral Forest.
    - Blooms/fruits May – June. Spring and early summer ephemeral, typically disappearing by late June.

State listed plant species surveys of the site should be performed by a qualified botanist or plant ecologist when these target plant species are identifiable. You may want your botanist to contact the NDDB program directly for more information regarding known plant locations. The report summarizing the results of such surveys should include:

1. Survey date(s) and duration.
2. Site descriptions and photographs, and photographs of any state listed plant species found.
3. Descriptions of the identifying characters of the target listed species.
4. List of component species within the survey area (including scientific binomials).
5. Data regarding population numbers and/or area occupied by state listed plant species.
6. Detailed maps of the area surveyed including the survey route and locations of state listed species.
7. Habitat descriptions of the area surveyed.
8. Survey results and all observed state listed plant species must reported to the NDDB Program using an NDDB form at: https://portal.ct.gov/DEEP/Endangered-Species/Contributing-Data
9. If state listed plants are found within the project area or immediately adjacent to the project area, the report should include a conservation/protection plan with the following elements:
    a. Anticipated impacts to these state-listed species from this project.
    b. Any planned mitigation or management practices that will be employed to protect, avoid, and/or mitigate impacts to state listed plant species.
10. A Statement, CV or Resume of the botanist's or plant ecologist's qualifications to work with these species. Please ensure that your botanist or plant ecologist holds appropriate scientific collector's permit for this work.

Grassland Birds

- Grasshopper sparrow (*Ammodramus savannarum*) – State Endangered
- Horned lark (*Eremophila alpestris*) – State Endangered
- Eastern meadowlark (*Sturnella magna*) – State Threatened
- Bobolink (*Dolichonyx oryzivorus*) – State Special Concern
- Savannah sparrow (*Passerculus sandwichensis*) – State Special Concern

The Project is expected to impact 5.6 acres of grassland habitat.

NDDB received an application to review this project in 2022 (NDDB Preliminary Assessment 202201593). Our preliminary assessment letter included information for the above-referenced grassland bird species, including general recommendations for managing grassland birds at airports and noted that field surveys are

recommended. The preliminary assessment also instructed that the airport should comply with any pre-existing mitigation plans prepared to protect grassland birds on the property. NDDB did not receive any communication in response to the Preliminary Assessment and closed that review on March 3, 2023.

NDDB was provided a copy of the *Grassland Bird Habitat Conceptual Plan*, dated April 8, 2024; this document was prepared to address prior permitting requirements for grassland habitat within the airport boundary, document existing grassland habitat, and to propose a study of bird use and functionality of existing grassland habitat at the airport. Through review of this plan, NDDB concluded that changes to conditions outlined in the original 2008 *Grassland Management Plan* had been made in 2009 and 2011; specifically, beginning in 2009, the mowing regime agreed to in that plan was no longer being followed. NDDB provided comments responsive to this *Grassland Bird Habitat Conceptual Plan* via email on April 25, 2024.

Following the meeting between DEEP staff and Tweed-New Haven Airport representatives on April 29th, 2024, it was made clear that there is no remaining suitable grassland habitat on the property due to the mowing regime adopted in 2009. NDDB has been informed that the changes were implemented in response to airport hazard assessment and are not likely to be revised.

The *Grassland Bird Habitat Conceptual Plan* proposes to conduct grassland bird survey studies in order to understand grassland habitat conditions and use of the property. As NDDB has indicated via email comments and during subsequent meetings, NDDB welcomes this survey work as a valuable source of information, and we concur with the survey protocols proposed. However, survey work and information gathering alone does not constitute mitigation for loss of habitat resulting from project activities.

We have included the protection measures here as a reference in the event that it is deemed possible to allow habitat to regenerate on the property in the future. Barring that, these guidelines can be used as a starting point in the development of an off-site mitigation plan, as it seems unlikely that negative impacts to listed grassland bird species neither have been nor will be able to be minimized on the airport property. Since impacts to grassland birds have already been committed and earlier plan mowing regimes are not able to be implemented, **off-site mitigation should be pursued**.

Grassland Bird Protection Measures

The horned lark, grasshopper sparrow, Savannah sparrow, bobolink and eastern meadowlark are considered to be grassland-obligate birds. They require open fields to breed, nest and forage in. Habitats preferred by these species include large grasslands, agricultural fields, and airports. The breeding season for these birds is approximately from late April through August. It is during this period that they are most susceptible to disturbances in their feeding and nesting habitat.

To avoid impact to these species:

- Land disturbance activities including digging, ground clearing, heavy machinery driving staging, or ground trampling that will occur more than 100 feet into a grassland parcel or cut across parcels of grassland in a way that fragments grassland habitat patches should be done when grassland birds are not breeding. Breeding primarily takes place between April 15- August 15.
- Conducting land disturbance activities outside of the breeding season will avoid impact to the individuals.
- **Conduct project work between August 16- April 14.**

- Any upland grassed areas that may be disturbed during the course of the project, should be reseeded using an FAA-approved mix of warm season grass species including:
  - Little bluestem (*Schizachyrium scoparium*)- "Aldous" or "Cimarron"
  - Big bluestem (*Andropogon gerardii*)- "Niagra"
  - Indiangrass (*Sorghastrum nutans*) - "Rumsey"
  - Switchgrass (*Panicum virgatum*) - "Blackwell", "Shelter", or "Cave in Rock"
  - Bermudagrass (*Cynodon dactylon*) - "Quickstand"
- Seed mix ratios are variable, however for Connecticut a minimum of 60% little bluestem is preferred. Big bluestem is an acceptable alternative to little bluestem for the dominant species in the chosen mix. When one of the bluestems is the dominant species the other grass species listed may be mixed in any ratio desired. Of these species, Bermudagrass is the least favored and should be used in the lowest percentage.

If work cannot occur between months of August 16-April 14:

- The proposed construction staging area and associated vehicles and equipment should be restricted to existing paved areas as much as possible.
- Beginning April 1- through duration of project: All grassy areas within a 50-foot buffer of planned work remain continuously mowed as short as possible to avoid attracting nesting birds into work zones.
- If vehicle access is required to cross grassy areas outside of work zones, designated paths and areas should be marked and kept mowed beginning April 1. Do not drive outside of designated work areas into grassy habitat, nesting birds will be crushed.
- Identify locations on the property where grassland habitat will remain un-mowed between April 15 - August 30 to mitigate for lost habitat during construction. These areas must provide adequate conditions for upland grassland habitat. Provide a map detailing these grassland mitigation areas to Robin Blum (robin.blum@ct.gov).
- Any upland grassed areas that may be disturbed during the course of the project, should be reseeded using an FAA-approved mix of warm season grass species as described above.

Your request has been assigned the following number: **107828; please include this number on all correspondence regarding this request**.
Responsive information should be sent to:

Robin Blum
Wildlife Division- Natural Diversity Data Base
79 Elm St. 6th Floor
Hartford, CT 06106-5127
or submitted via email to: robin.blum@ct.gov

Please note that if the necessary information is not received by May 20, 2025, we will be unable to provide a determination. Materials already submitted will not be retained or returned. You will need to initiate a new review request by submitting a new and complete *Request for Natural Diversity Database (NDDB) State Listed Species Review* via DEEP's ezFile Portal. For more information and guidance on submitting a request for a Natural Diversity Data Base review visit our website. Feel free to contact me if you have further questions.

Project: Tweed New Haven Runway Extension and Terminal Expansion – Tide Gate Alteration
NDDB 202408268 Request for Additional Information
Filing ID: 117005
Expiration date: September 24, 2025

Dear Deb Coon,

We have received and reviewed the materials submitted pursuant to a Natural Diversity Data Base review request for Tide Gate Alteration at Tweed Airport, New Haven project. According to our records, populations of State listed species have been documented in the vicinity of the project area.

Plants:

- Yellow thistle (*Cirsium horridulum*) – State Endangered
  Habitat: Coastal grasslands; airports; open-canopy trail sides and roadsides; inner salt marsh borders; *Juniperus-Panicum virgatum* communities, scrub communities, and forest edges bordering salt marshes.
  Blooms: June, July
- Salt pond grass (*Leptochloa fusca ssp. Fascicularis*) – State Endangered
  Habitat: Coastal, in brackish ponds and shores of "salt ponds", borders of salt and brackish marshes, sandy depressions in coastal grasslands and sandy roadsides that are flooded by the highest mesohaline or polyhaline spring tides of the year. Populations found inland growing along highways are not believed to be of native Connecticut provenance.
  Blooms and fruits August - November
- Field paspalum (*Paspalum laeve*) - State Threatened
  Habitat: Mostly near the coast, extending inland in the Connecticut River towns only as far as Cromwell and Glastonbury, and disjunct as a historic in Franklin. Hydric to moderately well drained fields, meadows, grasslands, floodplain grasslands and meadows, thickets, and shores, seasonally flooded and exposed open-canopy vernal pools. Utility ROWs, airports near the coast. Tolerant of mowing, at least at some sites. Critical Habitats include: Alluvial grassland/Outcrop, Grassland Subtype; Coastal Grassland.
  Fruits August – October
- Swamp lousewort (*Pedicularis lanceolata*) – State Threatened
  Habitat: Moist fields, swamp edges, wet ground, wet meadows, open swamps, stream edges, fresh tidal wetlands.
  Blooms mid-August, September
- Two-flowered cynthia *(Krigia biflora*) - State Threatened
  Habitat: Dry to wet meadows, fields, rocky woods, and roadsides.
  Blooms June
- Hoary plantain (*Plantago virginica*) – State Special Concern

Habitat: Dry acidic or basic, rocky, sandy, or gravelly soil. Pastures, grasslands, floodplain levee and stream bank forests, roadsides, low traprock outcrops in old fields, calcareous (high-pH) open woodlands, dry fields, gravel banks, traprock ridges. Critical Habitats: Subacidic Rocky Summit/Outcrop; Subacidc Rocky/Summit Outcrops (probably); Floodplain Forest, High Floodplain Subtype; Dry Circumneutral Forest. Blooms/fruits May-June. Spring and early summer ephemeral, typically disappearing by late June.

- New England blazing star (*Liatris novae-angliae*) – State Special Concern
  Habitat: Sandplains, dry fields, sandy sea beaches, rock outcrops, sandy or rocky roadsides.
  Blooms Aug, September

State listed plant species surveys of the site should be performed by a qualified botanist or plant ecologist when these target plant species are identifiable. You may want your botanist to contact the NDDB program directly for more information regarding known plant locations. The report summarizing the results of such surveys should include:

1. Survey date(s) and duration.
2. Site descriptions and photographs, and photographs of any state listed plant species found.
3. Descriptions of the identifying characters of the target listed species.
4. List of component species within the survey area (including scientific binomials).
5. Data regarding population numbers and/or area occupied by state listed plant species.
6. Detailed maps of the area surveyed including the survey route and locations of state listed species.
7. Habitat descriptions of the area surveyed.
8. Survey results and all observed state listed plant species must reported to the NDDB Program using an NDDB form at: https://portal.ct.gov/DEEP/Endangered-Species/Contributing-Data
9. If state listed plants are found within the project area or immediately adjacent to the project area, the report should include a conservation/protection plan with the following elements:
   a. Anticipated impacts to these state-listed species from this project.
   b. Any planned mitigation or management practices that will be employed to protect, avoid, and/or mitigate impacts to state listed plant species.
10. A Statement, CV or Resume of the botanist's or plant ecologist's qualifications to work with these species. Please ensure that your botanist or plant ecologist holds appropriate scientific collector's permit for this work.

Please send the survey report to deep.nddbrequest@ct.gov and robin.blum@ct.gov. Please note that incomplete reports may be rejected.

Fish:

- Sand tiger shark (*Carcharias taurus*) – State Special Concern
- Atlantic seasnail (*Liparis atlanticus*) – State Special Concern
- Radiated shanny (*Ulvaria subbifurcata*) – State Special Concern

Contact a DEEP Fisheries Biologist for more information regarding potential impacts to listed fish species. You may need to submit a fisheries consultation form.

Birds:

In Connecticut, grasslands are among the most threatened and rare habitats. There are seven species of breeding grassland birds and that require grasslands as their primary habitat that are state listed in Connecticut. Most of Connecticut's grasslands would revert to forest without active management. Increasing development pressures on Connecticut's most important grassland habitats, exacerbates this loss of habitat

through natural succession. Traffic and construction in suitable habitat should be avoided during sensitive timeframes.

Grasshopper sparrow (*Ammodramus savannarum*) – State Endangered
Most sensitive to disturbance: May 1- August 30. This species will benefit from protection and management of large patches of grassland of 30 acres or more.

Eastern meadowlark (*Sturnella magna*) – State Threatened
Most sensitive to disturbance between May 1- August 15. This species will benefit from protection and management of large patches of grassland of 15 acres or more.

Savannah sparrow (*Passerculus sandwichensis*) – State Special Concern
Most sensitive to disturbance between April 1- August 30. This species will benefit from protection and management of large patches of grassland of 10 acres or more.

Bobolink (*Dolichonyx oryzivorus*) – State Special Concern
Most sensitive to disturbance between May 1- August 30.
This species will benefit from protection and management of large patches of grassland of 5 acres or more.

NDDB program staff is currently working with Tweed Airport and consultants regarding proposed actions to address impacts to grassland birds under the auspices of the Runway Extension and Terminal Expansion project. Any potential negative impacts to listed grassland bird species from the proposed Tide Gate Alteration project activities will be addressed through mitigation under that project. A Final Determination for the Tide Gate Alteration project will not be issued until grassland bird mitigation has been finalized.

Good Afternoon Bill,

Please see the permission email below from Airport Manager of Tweed Airport in New Haven, CT for seed collection of *Paspalum laeve* var. *circulare* as part of the terminal expansion project mitigation strategy.

If you could send a confirmation email with your sign-off on this approval, I will set up a date next week for the seed collection activities.

Thanks so much and I hope you have a good day,

Tom Groves

That's great Kate! Thanks for letting me know. I'm in talks right now with CTDEEP and NDDB to determine what the mitigation strategy will be at the site. Once I know that, I'll know if it's a long term storage or a more short term one. I've cc'd Michael here again in the hopes of touching base with him and getting those two contracts set up for the seed banking.

Thank you for all you do, and I hope you have a nice Thanksgiving,

Tom Groves

Subject: Re: Paspalum laeve var. circulare Seed Collection Tweed Airport New Haven, CT

Hi Tom,

I just picked up the Paspalum collection, safe and sound. Nice to see that you were able to harvest so many seeds.
When you work out the contract details with Michael, you two can decide whether this is for a relatively short window of storage, or a longer one. When we store collections for the longer term (usually >2 years), we often ask contract collectors if we can split their collection into two halves: one half we store in our own facilities at Native Plant Trust, and the other would go to an off-site storage facility.
This is generally known as "safety duplication storage", the idea being that if a natural disaster struck one seed bank facility, the other half of the collection would still be safe at the second one.
When working with contract collectors, we generally ask them if they would like their seeds to be stored in this way, or if they prefer that they stay together within the Native Plant Trust seed bank.
Either way is fine, though I suppose it's worth knowing that if half of the collection were to be sent off-site, it may take longer to recall those seeds if and when you would like them back. You can Michael and discuss the particulars and let me know.

Best wishes,
Kate

Hello Kate!

I've been emailing with Michael (cc'd here) about some seed banking services for two projects I've been working on. Michael said it would be fine for me to send along the seeds I'll need banked to you at NASAMI but to give you a heads up first. The projects I'll be sending seed for are as follows:

1. A1/B2 Transmission Line Vernon, VT (*Viola lanceolata)* – seeds have already been collected and sorted – this is the same project and client (NEP) that I sent you seeds of *Bartonia virginica* and *Crocanthemum bicknellii* from last season.
2. Tweed Airport New Haven, CT (*Paspalum laeve* var. *circulare*) – seeds will be collected on 11/5/24

I will send each species in separate packages and will work out the contract details with Michael over the next couple of weeks. I will send the seeds out and email you tracking numbers as soon as I have them. Please let me know if you have any questions and thanks for everything you all do!

Talk to you soon,

Tom Groves

Hi Tom,

Good to hear from you. Please do send the Paspalum seeds once you have them to Kate at Nasami, and if you can send her a quick email regarding when to expect the seeds we should have no problem getting them processed and ready for freezing relatively quickly. We can work on a contract template in the meantime (estimate for short-term storage would be the same as last agreement, I believe). Thanks for reaching out.

Best,

Michael

> Good Afternoon Michael,
>
> I hope you're doing well since the last time we spoke about seed collections and seed banking for some Vermont species. I've recently been performing rare plant surveys at Tweed Airport in New Haven, CT for airport improvement projects they've proposed. I observed a massive population of *Paspalum laeve var. circulare* on the property and have been working with Bill Moorhead and the airport to gain permission to collect seeds in impacted areas for long-term seed storage. Part of what I'll need to do is send the collected seed to NASAMI Farm for seed banking, do you need me to set up a seed banking contract with you similar to how we proceeded last year? I'm happy to get that together and out but in the meantime, if I collect seeds next week (since the window is closing) would I be able to send them to Kate Wellspring at NASAMI with a note and get them in the freezer ASAP?
>
> This is the permission received from the airport and I've cc'd Bill Moorhead here who is in the loop on the details and asked for you all to be looped in as well.

Good Afternoon Bill,

It was nice to speak with you last week. I reviewed the total area of *Paspalum* impact in the new Terminal area at Tweed Airport. The estimated impact areas/take areas will be no more than for the big polygons is roughly 0.6 ac. So adding in the single occurrence plants it's maximum of 1 acre of direct *Paspalum* impacts. The proposed mitigation for this species to segregate topsoil and allow the Turf to Turf conversion areas to naturally revegetate totals 31 acres. Let me know if you need any other information for this.

Thank you,

Tom

ATTACHMENT 23 – FISHERIES CONSULTATION FORM

Connecticut
Department of Energy & Environmental Protection
Bureau of Natural Resources
Fisheries Division

DEEP Fisheries Consultation Form

To the Applicant - Prior to the submission of your license application to the Connecticut Department of Energy & Environmental Protection (DEEP) Water Planning and Management Division (WPMD) or Land and Water Resources Division (LWRD) or Water Permitting and Enforcement Division (WPED), please complete Part I below and e-mail the following to deep.inland.fisheries@ct.gov:

1. this completed DEEP *Fisheries Consultation Form*;
2. a site location map,
3. a PDF version of the proposed project plans including a site survey of existing conditions (if available), and
4. photos of the site.

Fisheries Division staff will contact you if further details are needed. Once the Fisheries Division staff returns the completed form to you, please include the form, and any signed plans (if applicable) in your license application submittal to DEEP.

Part I: Applicant and Site Information (*to be completed by APPLICANT)*

1. Applicant/Registrant Information

Name: Tweed New Haven Airport
Mailing Address: 155 Burr Street
City/Town: New Haven State: CT Zip Code: 06512
Business Phone: 203-4695650 Ext.: _____
Contact Person: Jeremy Nielson Phone: Ext: _____
E-mail Address: JNielson@avports.com

2. Engineer/Surveyor/Agent Information (list as applicable)

Name: Hoyle, Tanner & Associates, Inc.
Mailing Address: 150 Dow Street
City/Town: Manchester State: NH Zip Code: 03101
Business Phone: 6034605205 Ext.: _____
Contact Person: Kimberly Peace Phone: 6037163343 Ext: _____
E-mail Address: kpeace@hoyletanner.com
Service Provided: Design Engineering & Permitting

3. Site Location:

Name of Site: Tweed New Haven Airport
Address of Site or Location Description: 155 Burr Street
City/Town: New Haven State: CT Zip Code: 06512
Parcel Location/Tax Assessor's Reference: Map 120 Block 1409 Lot 001
Name of Stream or Waterbody: Morris Creek, Tuttle Brook and tidal wetlands associated

4. **Activity:** Check the box best describing your activity: (check all that apply):

- ☐ new public/fishing access;
- ☐ new docks and marinas on tidal rivers;
- ☒ coastal/tidal dredging projects;
- ☒ activities in inland/non-tidal waterbodies and watercourses;
- ☐ maintenance dredging
- ☐ beach nourishment
- ☐ cofferdam installation
- ☐ conducting construction activity within a 100-foot buffer of a Cold Water Stream Habitat
- ☐ work within LIS Blue Plan area
- ☐ Other
- ☐ withdrawal of water from a non-tidal/inland river, stream, pond or lake;
- ☐ withdrawal of water from a wetland, marsh, swamp, or bog hydrologically connected to a non-tidal/inland river, stream, pond or lake;
- ☐ withdrawal of groundwater from stratified drift deposits hydrologically connected to a non-tidal/inland river, stream, pond or lake.

Note: Fisheries consultation is **not required** for docks and marinas on Long Island Sound.

Part I: Applicant and Site Information (*to be completed by APPLICANT) (continued)*

5. **DEEP Pre-application Contact:** Indicate name of permit analyst or engineer, if applicable.
   Jeff Caiola & Robin Blum

6. **Project Description:** Provide or attach a brief, but thorough, description of the project including any measures to protect, enhance or restore fish populations:

The project proposes to rehabilitate and extend Runway 2-20, construct a new east side passenger terminal and associated roadways, parking lots, aprons and taxiways. Included with the project is a plan to restore 30 acres of historically impacted tidal wetlands around the airport as a form of mitigation to offset wetland impacts. The NDDB review attached is associated with review of these tidal areas to be restored. Restoration efforts will initially include alteration of the existing tide gate at Morris Creek to allow for longer and deeper salinity events within the tidal channels to effectively drown Phragmites and allow for conversion to a more natural Spartina-dominated salt marsh. Removal of standing Phragmites will also occur to promote this conversion. If this initial effort is not deemed to meet the success criteria within a 2-3 year period, other efforts will include plantings, alteration of existing tidal channels and/or creation of additional tidal channels in the marshes, and soil manipulation as needed. The water levels in the marshes are currently controlled by a tide gate at Morris Creek downstream of the airport that was installed to prevent flooding of the neighborhoods along the southwest side of the airport.

Attached are: an aerial figure denoting areas of impact for the Runway extension, drainage improvements and east terminal areas as well as the tidal mitigation areas, the NDDB submission, and the NDDB response. We can provide wetland delineation reports for tidal wetlands that contain photos in subsequent emails due to size. There are no plans created for the tidal marsh restoration at this time.

Part II: Fisheries Determination *(To be completed by DEEP Fisheries Staff only)*

To Fisheries Staff - This completed consultation form is required to be submitted as part of an application to DEEP. The application has not yet been submitted to DEEP. Please review the enclosed materials and determine whether the project will significantly impact any fisheries or fisheries habitat. You may provide comments or recommendations regarding the proposal. Send this completed form to the applicant and copy the DEEP analyst, if known, or the applicable WPMD/LWRD/WPED Supervisor. If the proposed work **WILL** significantly impact any fisheries and/or habitat or if you have any comments or concerns regarding the regulatory review for this project, contact the DEEP analyst, if known, or the applicable WPMD/LWRD/WPED Supervisor.

DEEP FISHERIES DIVISION DETERMINATION

Date Consultation Form received: 11/01/24

Please check applicable boxes and return the completed Consultation Form to the applicant:

- ☐ I have determined that the work described in Part I of this form and attachments **WILL NOT** significantly impact any fisheries and/or habitat;
- ☑ I have determined that the work described in Part I of this form and attachments **WILL NOT** significantly impact any fisheries and/or habitat **if the below Recommendations are followed**; and/or,
- ☐ I have determined that the work described in Part I of this form and attachments **WILL NOT** significantly impact any fisheries and/or habitat **if the design features shown on the attached plans are incorporated**. Fisheries staff to sign and date plans and return to the applicant with the completed Consultation Form.

Hi Bruce, at DEEP's request we have added approximately 3.6 acres of tidal wetland creation to the Wetland Mitigation Plan, see figure attached for those locations. We do not anticipate that this would result in a change in

your response, however we want to provide you with the opportunity to review this change and, if needed, update your comment memo that will be used in the permit application to support the NDDB Determination.

Please let me know if you want to discuss this further or have questions, thank you.

Memo

To: Kimberly Peace, Vice President, Senior Environmental Coordinator at Hoyle Tanner

From: Bruce Williams, Senior Fisheries Biologist, CTDEEP Fisheries Division

CC: Elsa Loehmann, P.E. eDesign Dynamics, Matt Goclowski, Supervising Fisheries Biologist

Date: 02/05/25

Re: Response to memorandum from eDesign Dynamics on the proposed Tweed New Haven Runway Extension and Terminal Expansion Wetland Mitigation Plan

---

After reviewing the memorandum from eDesign Dynamics and consulting with other CTDEEP Fisheries staff, it is the opinion of the Fisheries Division that the assertions made in the memo understate the value of the fisheries resources of the Morris Creek watershed. Elsa Loehmann stated that, “the upstream environment beyond the tide gate does not provide viable habitat for local populations of the species of interest”. The total drainage area upstream of the tide gate covers an area of approximately 4.1 square miles. The fisheries habitat of Morris Creek directly upstream of the tide gate is not substantially different from the habitat downstream of the gate. The creek maintains a minimum channel width of 50 feet for at least 0.34 miles upstream of the gate and Tuttle Brook maintains a minimum channel width of 50 feet for a distance of approximately 0.32 miles upstream from its confluence with Morris Creek. The Fisheries Division is interested in all fish species, but there are species of specific interest to recreational anglers. Between 1990 and 1996 the DEEP Fisheries Division Marine Recreational Angler Survey conducted creel surveys of anglers fishing the lower sections of Morris Creek, mostly from Lighthouse Road and Sibley Lane. A total of 58 interviews were conducted and the reported catches included the following species, ranked from most abundant to least abundant:

1. Striped Bass
2. Bluefish
3. Winter Flounder
4. Summer Flounder
5. Tautog
6. Atlantic Menhaden
7. Scup
8. Weakfish
9. American Eel

Many of these species, probably excluding Tautog and Scup, would seasonally utilize habitat upstream of the tide gate if given the opportunity.

The Fisheries Division also understands that the upper marshes near the airport and Tuttle Brook have been heavily impacted by development, but to claim that, “neither Tuttle Brook nor the adjacent marshes provide suitable upstream habitat for sustaining local fish populations” is highly speculative and not supported by data. Tuttle Brook upstream of Dodge Avenue has a drainage area of 2.24 square miles and an estimated Q75 for the month of May of 2.47 cfs. It would be unusual for a watercourse of this size not to support fish of any species.

Recommendations for Tide Gate Management

The current configuration of the tide gate has one sluice gate on the north and south sides of the channel and three flapper gates in the middle. Based on details provided in the memorandum from eDesign Dynamics, dated January 22, 2025, the proposed design involves replacement of the existing flapper gates with an additional sluice gate. Typically the best option for fish passage would be to replace the flapper gates with self-regulating tide gates (SRTG). SRTGs are adjusted to remain open during a portion of the flood tide, providing fish passage during both the ebb tide and a percentage of the flood tide. Sluice gates are less desirable due to the reluctance of some species to pass through submerged orifices and the velocity barriers that can occur during some stages of the tide, but are generally an improvement over flapper style gates. In this particular case, the constraints of needing to raise water levels for marsh restoration while still providing flood protection for the airport and surrounding community impact the feasibility of self-regulating tide gates as a design alternative. They would not provide the ability to make the fine adjustments in upstream water elevations required for marsh restoration. The replacement of the three flapper gates with a sluice gate will benefit fish passage in Morris Creek watershed and the proposal has the support of the Fisheries Division.

ATTACHMENT 27 – USACE CONSULTATION FORM

Per correspondence with Jared Pritts, USACE, the applicants were informed this consultation form is no longer required.

ATTACHMENT 28 – USACE ENG FORM 4345

U.S. Army Corps of Engineers (USACE)

APPLICATION FOR DEPARTMENT OF THE ARMY PERMIT

For use of this form, see 33 CFR 325. The proponent agency is CECW-COR.

Form Approved - OMB No. 0710-0003 Expires: 2027-03-31

The public reporting burden for this collection of information, OMB Control Number 0710-0003, is estimated to average 11 hours per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding the burden estimate or burden reduction suggestions to the Department of Defense, Washington Headquarters Services, at whs.mc-alex.esd.mbx.dd-dod-information-collections@mail.mil. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to any penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number. PLEASE DO NOT RETURN YOUR APPLICATION TO THE ABOVE EMAIL.

Michael Jones — SIGNATURE OF APPLICANT

Apr 22, 2025 — DATE

NAME, LOCATION, AND DESCRIPTION OF PROJECT OR ACTIVITY

12. PROJECT NAME OR TITLE (see instructions)

Tweed New Haven Airport Runway Extension and Terminal Expansion

13. NAME OF WATERBODY, IF KNOWN (if applicable)	14. PROJECT STREET ADDRESS (if applicable)
Morris Creek/Tuttle Brook, freshwater and tidal wetlands	Address 155 Burr Street
15. LOCATION OF PROJECT	City - New Haven State- CT Zip- 06512
Latitude: ◦N 41.262128° Longitude: ◦W -72.885851°	

16. OTHER LOCATION DESCRIPTIONS, IF KNOWN (see instructions)

State Tax Parcel ID 120-1409-001 / 28-900-100 Municipality East Haven / New Haven

Section - Township - Range -

17. DIRECTIONS TO THE SITE

From the North, Follow I-91 S to Main Street Anx in New Haven. Exit from I-95 N, Head southwest on I-91 S, Use the left lane to merge onto I-95 N, Take the exit toward Main Street Anx, Continue onto Main Street Anx, Turn right onto Townsend Ave, Turn left onto Fort Hale Rd, Turn right onto Burr St, Turn left into Airport.

18. Nature of Activity (Description of project, include all features)

Tweed New Haven Airport (HVN) proposes the extension of Runway 02-20, drainage improvements and the replacement of the existing West Terminal with a new terminal ("East Terminal") on previously disturbed land on the east side of the Airport property. Additional elements associated with the East Terminal include associated roadways, parking lots, aprons and taxiways. Enhancement of tidal wetlands and creation of new tidal wetland areas is included as proposed Permittee-Responsible-Mitigation (PRM) as part of the project. See attached Executive Summary and Narrative for additional details.

19. Project Purpose (Describe the reason or purpose of the project, see instructions)

The purpose of the project is to provide airfield and terminal area facilities to accommodate existing and reasonably foreseeable aircraft operations and passenger volumes. The Airport Authority's goal is to ensure that Tweed New Haven Airport (HVN) can efficiently meet current and future aviation needs by improving airside and landside operations. HVN needs to strive for better utilization of available land (currently underutilized) to support existing tenants and airport dependent users. The project would improve the operational flexibility resulting in a more efficient and sustainable airport and provide better landside access through non-residential areas avoiding the New Haven and East Haven neighborhoods.

The goal of the project is to enhance efficiency and terminal area capacity and alleviate the operational constraints at HVN while ensuring the Airport continues to develop in order to provide an airport facility that reliably and safely offers consistent and adequate level of service for the forecasted demand. The project would allow HVN to respond effectively and efficiently to current needs, future changes, and air service improvements in southern Connecticut. Specifically, the Project would address operational constraints through the runway extension and replacement of the existing terminal with a new East Terminal. This would include associated landside (parking and roadways) infrastructure and aircraft parking areas in a manner that efficiently utilizes the available land within the airport developed footprint.

Work will begin in Spring of 2026 and take approximately 2 years to complete.

USE BLOCKS 20-23 IF DREDGED AND/OR FILL MATERIAL IS TO BE DISCHARGED

20. Reason(s) for Discharge

Wetlands will be filled to allow for construction of the new terminal, parking lots, access road and causeway. See Executive Summary and Narrative and project plans attached.

21. Type(s) of Material Being Discharged and the Amount of Each Type in Cubic Yards:

Type Amount in Cubic Yards	Type Amount in Cubic Yards	Type Amount in Cubic Yards
refer to project plans attached		

22. Surface Area in Acres of Wetlands or Other Waters Filled (see instructions)

Acres refer to Attachment 16 Impact Table

or

Linear Feet

23. Description of Avoidance, Minimization, and Compensation (see instructions)

The proposed 28.5 acres of tidal wetland enhancement will be credited toward mitigation at a 5:1 ratio, offsetting 5.7 acres of impact. Proposed creation is 3.61 acres. to offset remaining impacts, exceeding the USACE requirements. refer to the attached Executive Summary and Narrative for full description of alternative analysis, avoidance and minimization, and the Attachment 17 Mitigation Plan.

24. Is Any Portion of the Work Already Complete? ☐ Yes ☒ No IF YES, DESCRIBE THE COMPLETED WORK

25. Addresses of Adjoining Property Owners, Lessees, Etc., Whose Property Adjoins the Waterbody (if more than can be entered here, please attach a supplemental list).

a. Address- 6 South End Rd

City - East Haven State - CT Zip - 06512

b. Address- Uriah Street

City - New Haven State - CT Zip - 06512

c. Address- South End Road

City - New Haven State - CT Zip - 06512

d. Address- 51 South End Rd

City - New Haven State - CT Zip - 06521

e. Address- Morris Cswy

City - New Haven State - CT Zip - 06521

26. List of Other Certificates or Approvals/Denials received from other Federal, State, or Local Agencies for Work Described in This Application.

AGENCY	TYPE APPROVAL*	IDENTIFICATION NUMBER	DATE APPLIED	DATE APPROVED	DATE DENIED
